

THE VALUE OF WORKER RIGHTS IN COLLECTIVE BARGAINING

Benjamin W. Arold, Elliott Ash, W. Bentley MacLeod, Suresh Naidu*

March 20, 2025

Abstract

This paper proposes novel natural language methods to measure worker rights from collective bargaining agreements (CBAs) for use in empirical economic analysis. Applying unsupervised text-as-data algorithms to a new collection of 30,000 CBAs from Canada in the period 1986-2015, we parse legal obligations (e.g., “the employer shall provide...”) and legal rights (e.g., “workers shall receive...”) from the contract text. We validate that contract clauses provide worker rights, which include both amenities and control over the work environment. Companies that provide more worker rights score highly on a survey indicating pro-worker management practices. Using time-varying province-level variation in labor income tax rates, we find that higher taxes increase the share of worker-rights clauses while reducing pre-tax wages in unionized firms, consistent with a substitution effect away from taxed compensation (wages) toward untaxed amenities (worker rights). Further, an exogenous increase in the value of outside options (from a leave-one-out instrument for labor demand) increases the share of worker rights clauses in CBAs. Combining the regression estimates, we infer that a one-standard-deviation increase in worker rights is valued at about 5.7% of wages.

1 Introduction

Labor economists have long been interested in the effects of collective bargaining agreements (CBAs) on wages, benefits, and employment (e.g. Farber et al., 2021; Martins, 2021; Card and Cardoso, 2022). Yet CBAs are about much more than worker compensation, often extending across dozens of pages, with hundreds of legally binding plain-text clauses to go along with lists of positions and tables of wages. Is this text merely “cheap talk”? That is to say, are legal rights ancillary to wages and enumerated benefits, or do they have economic value to workers and/or firms? Drawing on tools from unsupervised natural language processing, this paper measures the legal content of collective bargaining contracts and shows that they largely consist of rights for workers (rather than for firms). Further, the prevalence of worker-rights language responds to exogenous economic shocks just as the economic theory of non-wage amenities predicts.

A contract’s legal content governs a large number of workplace rights and duties, including a variety of non-wage amenities (Budd, 2017; Corradini et al., 2022; Freeman and Medoff, 1984), such as vacations, pension plans, promotions, dismissal rules, scheduling, and even bathroom breaks. Many of these clauses are fiercely bargained over by highly compensated and trained lawyers and negotiators (McAlevey and Lawlor, 2023). The substantial legal and financial resources expended on refining legal details of collectively bargained texts suggest that both firms and unions care about both the broad content and specific wording of contract clauses. Without a contract, management may not be able to commit to providing rights at the levels workers would choose for themselves, as they would cost too much in terms of interrupted work. Many of these contracted rights have pure option value, in the sense that they can be exercised by workers during the production process without permission from a manager. And workers are often not aware of which rights they have – at least not until those rights are grieved or litigated. When the contract is breached, there is a formal grievance process and legal arbitration based on what is written down in the agreement, with potentially costly sanctions.

Regardless of whether they are written in a contract, workers value on-the-job amenities (Lavetti, 2023), including control rights such as the ability to work from

home (Bloom et al., 2015; Mas and Pallais, 2017, 2020; Cai and Wang, 2022). Yet detailed measures of non-wage benefits and workplace rights have largely come from surveys and cover only relatively narrow sets of workplace conditions (Dube et al., 2022a; Maestas et al., 2023). Our paper leverages the text of collective bargaining agreements to inductively measure a large set of worker rights, from amenities such as vacations and pensions to control rights such as dismissal rules and scheduling. In the context we study, where managers have residual rights of control over uncontracted actions, we would expect most contract language to grant workers privileges – and indeed this is what we find.

Using data from union contracts in Canada, we show that contracted worker rights clauses behave as would be expected if they were non-pecuniary worker benefits in an economic model of union bargaining. In particular, worker rights clauses increase relative to wages when provincial taxes increase, similar to early work by Gruber and Poterba (1994) showing that taxes increase health benefits relative to wages. Further, both worker rights and wages increase when contracts are negotiated in periods of high labor demand, consistent with more recent work by Lagos (2024) showing that improved union outside options during collective bargaining alters the text of CBAs in a pro-worker direction.

To measure worker rights from contract text, we combine ideas from computational linguistics with the legal semantics of rights and duties (Hohfeld, 1913). The large number of clauses with complex structures and contingencies makes coding each clause by hand very difficult. Further, the widespread statistical measures of text constructed from word counts, n-grams, or language embeddings do not work well in our setting because they miss small differences in language that would radically change the legal meaning of a clause — e.g., replacing “may” with “must”, or replacing “shall” with “shall not.” Our structural approach to text analysis adapts recent innovations in dependency parsing to construct grammatically precise representations of natural language (Ash et al., 2020). These grammatical structures are particularly important for extracting legal content, versus say political or media content (Solum, 2013; Solan, 2018).

The method begins by constructing dependency trees for each sentence, parsing contractual clauses into linguistic primitives of subjects, verbs and objects. A sentence’s verb structure, especially deontic modal verbs like “shall” or “may” (Kratzer, 1991), determines whether a clause is a right, permission, obligation, or prohibition.

The subject determines whether the clause applies to workers, unions, employers, or managers. For example, “the employer shall...” indicates a firm obligation, while “employees receive...” indicates a worker right. The remaining text of the clause (i.e. the object) is dimension-reduced by producing sentence vectors and then grouping them into topics via a clustering algorithm. This structural approach to contracts is scalable, transparent, reproducible, and interpretable, and it could be adapted to many legal domains.¹

We implement the approach in a new corpus of 30,000 collective bargaining agreements from Canada, 1986-2015. Ideally for our purposes, Canada has decentralized firm-level contract negotiation, a high-quality and comprehensive corpus of contract text, and a provincial structure of union regulation. We find that Canadian labor contracts consist mainly of worker rights, worker obligations, and firm obligations.

Qualitatively, the measured worker rights look like a combination of amenities – e.g. holiday pay, sick leave – and control rights – delegations or specifications of decision procedures. Asking a large-language model to do pairwise comparisons of clause types as being more/less beneficial to workers, we find that worker rights are scored as the most likely clause type to benefit workers. Further, we find that the share of worker rights in a union contract is correlated with pro-worker dimensions of the World Management Survey’s measure of the associated firm’s human resource practices (Bloom et al., 2012). Other clause types are either uncorrelated or negatively correlated with pro-worker HR practices.

To the extent that these contracted rights serve as an untaxed amenity, we expect that the prevalence of worker rights clauses might respond to changes in tax rates on wage income. Hence, we empirically examine the effect of provincial effective labor income tax rates, which alter the relative price of wage and non-wage amenities. We identify these effects relying on the fixed schedule of contract expirations as well as a wide set of covariates, including other provincial labor laws, along with province-sector and sector-year fixed effects.

We find that tax increases are associated with an increase in worker rights clauses, consistent with a substitution effect away from taxed compensation (income) and toward untaxed compensation (rights). That result holds in a staggered event-study design and is robust to a number of alternative specifications, including the addition

¹In Section 4.6 below, we provide a longer discussion of the merits of the structural approach, including a comparison to potential LLM-based approaches.

of firm fixed effects, union fixed effects, and province-specific time trends. It also holds in an IV specification in which we isolate exogenous changes in *province* income tax through changes in *federal* tax rates and associated deductions/credits (Gruber and Saez, 2002; Akcigit et al., 2021).

A second factor determining contract terms is the relative bargaining power of employers and employees. To look at this, we analyze the effect of changes in the (un)employment rate in a local sector. We calculate a leave-one-out employment rate in a given sector as the average of log employment rates in other sectors to isolate labor demand shocks. We find that exogenous increases in the local employment rate – presumably reflecting stronger worker outside options and a tighter labor market – are associated with increases in worker rights. This effect holds in a range of alternative specifications including event studies.

Overall, we can understand these effects as reflecting worker rights behaving like a non-wage amenity. To understand which clauses workers value, we run separate regressions for the effect of taxes and labor demand on different types of worker rights. We find that for both taxes and employment, the largest effects are on scheduling and other rights around time use. Control over time seems to be especially valuable to workers, although these are the exact amenities that would not be measured in standard lists of priced amenities such as health benefits or pensions.

How much do workers value rights? We find that income tax increases boost pre-tax wages, and more so for non-union than union workers. That effect is consistent with union contracts adjusting the mix of wages and amenities in response to tax changes. Dividing the worker-rights response by the differential union wage response to taxes allows us to recover an elasticity of substitution between wages and worker rights (as measured in text), and thence to put a value of worker-rights language in monetary terms. Based on this calculation, we find that a one-standard-deviation increase in the contract share of worker rights clauses is equivalent in value to a 5.7% increase in worker wages.

We interpret these results as a consequence of firm-union bargaining with incomplete contracts. This can be modeled by assuming firms set wages and worker rights under a strike threat, where ex-ante contracted rights are costly to draft and provide a public good for workers. Contracted worker rights protect worker options to exercise amenities during the production process, while uncontracted amenities can be denied by firm management. Our empirical results on income taxes and outside

options affecting rights emerge naturally from this framework. Bargaining in the face of a strike threat also generates the prediction that an increase in tax rates would increase strike intensity, a prediction for which we find suggestive evidence.

These findings add to the longstanding literature on collective bargaining and unions (Freeman and Medoff 1984; Farber 1986; MacLeod 2011; Cazes et al. 2019). There has been a recent resurgence of interest from both policymakers and academics on the economic effects of unions and collective bargaining on wages and employment in a variety of countries and contexts, often using administrative data (Card and Cardoso, 2022; Jäger et al., 2024). While the union effect on productivity is ambiguous (Doucouliagos and Laroche 2003, 2009; DiNardo and Lee 2004; MacLeod 2011), in the U.S. and Canada, unions have historically been an important force in compressing the wage (and income) distribution (DiNardo et al., 1996; Card, 2001; Farber et al., 2021).²

Getting at the granular textual details of contracts is the core of this research. We build on recent work applying computational techniques from natural language processing to the text of written contracts (Sanga, 2014; Moszoro et al., 2016; Ganglmair and Wardlaw, 2017), which in turn is part of a growing area of empirical research using text data by economists and other social scientists (Roberts et al., 2013; Gentzkow and Shapiro, 2010; Gentzkow et al., 2017a,b; Ash and Hansen, 2023). In labor economics, recent work using topic models to analyze contracted amenities includes Lagos (2024) and Corradini et al. (2022). Our innovation is to use concepts from formal linguistics, especially deontic modal verbs, to evaluate the legal incidence of contractual language on different parties to the contract (see Ash et al., 2020). Recent natural language parsing methods, combined with transformer-based semantic sentence encoders, are used to form quantitative representations of rights and obligations from contract text. Using legally relevant linguistic ideas allows for a more systematic and reproducible processing of contract language than supervised-learning methods based on human

²Other related work includes the hysteresis in contract terms documented in Card (1986), suggesting that observed union contracts cannot be viewed as achieving the first best. There is also a large literature in labor and legal history, sociology, and political science concerned with the interaction of labor laws and labor contracts. Research that focuses on hand-coded features of union contracts includes Juravich et al. (2006) and Strunk and Grissom (2010). Stepan-Norris and Zeitlin (2003) argue that certain contract provisions, such as strong stewards, were a key distinctive demand of particularly politicized unions in the post-war period. McCammon (1990) and Pope (2004), among others, have argued that court interpretations of the Wagner Act have been decisive in weakening the strike provisions in contracts.

labeling of complex contract features.

The rest of this paper is organized as follows. Section 2 provides an institutional background and outlines the data sources. Section 3 describes the text data and methods used to extract relevant clauses. Section 4 provides evidence validating worker rights clauses as a measure of worker amenities and authority. Section 5 outlines the econometric approach and reports the empirical results on how rights respond to tax and employment changes. Section 6 concludes.

2 Background

This section first provides an institutional background on collective bargaining and unions in Canada. Second, it outlines the data sources.

2.1 Collective Bargaining in Canada

Canadian collective bargaining has a number of attractive institutional features for our setting. Like the U.S., Canada is a common-law country with de-centralized bargaining at the firm level.³ The difference between U.S. and Canadian labor market institutions has been the subject of considerable work in economics and industrial relations (Card and Freeman 1993, Card et al. 2004, Card et al. 2020). Eidlin (2018) provides a recent account of the historical origins and the political economy of the divergence between U.S. and Canadian labor union density.⁴ While Canada has maintained a higher union density than the U.S., the process of collective bargaining is still somewhat similar between the two nations. Further, and perhaps most importantly, Canada has a comprehensive database of collective bargaining agreements available for use by researchers.

In Canada, collective bargaining is regulated at the “jurisdiction” level, where in most cases the relevant jurisdiction is the province. Labor law includes rules on the process of union recognition (card check vs. secret ballot election), for example, and restrictions on replacing striking workers. Many provinces also have “mandatory

³Note that the Province of Quebec is a civil law jurisdiction. For this reason, we do not consider French language contracts.

⁴Kuhn (1998) reviews the empirical evidence on the productivity of unions in Canada. His evidence suggests that public sector unions in Canada reduce productivity, but there is little evidence of this for private sector unions.

arbitration” where disputes between unions and employers are automatically referred to a labor tribunal, while other provinces allow alternative dispute resolution processes, e.g. mediation, before the case goes to an arbitrator.⁵ Overall, this means that there is important variation in labor policies across provinces, so there will be important variation in the content of collective bargaining agreements across provinces even within the same sector or same national union. That is unlike many European contexts, where the national unions hold a large influence even over local bargaining matters, for example by setting agreements that cover entire sectors. In Canada contracts are negotiated at the firm level by local union representatives. Those local unions bargain around and in response to local provincial rules and policies.

Collective bargaining agreements are legally binding contracts with meaningful sanctions for breach. However, there are some restrictions on what can be put in a contract. For example, there are basic rights in employment law and in the broader Charter of Rights and Freedoms that cannot be abrogated by a collective bargaining agreement. Further, there are unwritten “implied obligations”, for example that employers are not to harass and workers are not to shirk. These also vary by jurisdiction.

A core issue in interpretation of the language of collective bargaining agreements is whether or not the employer has residual control rights, as is the case under Canadian common law (originating with British Master and Servant law), and consistent with the property-rights approach to the theory of the firm (Grossman and Hart, 1986). In an influential law review article written before he became a justice on the Canadian Supreme Court, Bora Laskin (1952) distinguished the collective bargaining regime from the common law regime. Collective bargaining agreements are treated more in line with civil law norms, where disputes rely upon the text of the agreement (Brown et al., 2019). This in turn implies that parties prefer more specific, and hence longer contracts. (Doorey 2020). In particular, if a right has not been specifically provided, then workers cannot claim that right. Further, any limitations or contingencies on rights have to be explicitly contracted upon, suggesting that worker obligations should also increase with worker rights.

From the perspective of both workers and firms, a notable distinction in the set of granted provisions are those around priced and unpriced rights. That is, contracts could grant wage-like priced amenities, such as vacations and health benefits,

⁵Legree et al. (2017) provide a summary of provincial collective bargaining regimes and show that these have significant, if small, effects on unionization rates.

or else unpriced amenities and control rights, such as rules around scheduling and grievance procedures. In Canada, as in other contexts, significant bargaining energies are invested in both types of amenities.

2.2 Data Sources

Our data source for Canadian contracts is Employment and Social Development Canada, from which we obtained more than 32K contracts in the English language for the years 1986 through 2015 (this is after removing about 10K French-language contracts), along with metadata (company, year, etc) by contract.

Our data have 32,402 contracts, 7,572 companies (~4 contracts per company), 10 provinces and 3 territories, 906 cities, 11 industry groupings, and 606 industry codes (NAICS codes).⁶ Table A.1 reports summary tabulations for the provinces and industry groups. Quebec has relatively few contracts in our sample because most of them are in French and thus excluded.

For each contract, we have the company, union, location, industry, public/private status, and number of employees. We have a set of related dates (signing, effective, and expiry), which allows us to compute contract duration, and match up to short-term changes in economic conditions.

Table 1 provides summary statistics on these variables. Figure A.1 provides histograms for a selection of the real-valued variables. About half of the firms are in the private sector. The number of employees is widely dispersed. There is significant variation in contract duration, with bunching at 12-month increments. A good number of firms have COLA clauses, with meaningful variation in the gap between COLA and inflation.

Next, we have local labor market data from the Canadian Labor Force Survey. We have numbers by province, sector, and year, for population, labor force, full-time employment, and part-time employment. We use these numbers to compute employment rates by province, sector, and year. In addition, we have data on the implicit personal income tax rate, by province and year, from the Center for the Study of Living Standards.⁷ Summary statistics for these data are reported in Table 1.

⁶Provinces exercise constitutional powers in their own right, the territories exercise delegated powers under the authority of the Parliament of Canada. Throughout the paper, provinces and territories are treated the same and referred to as provinces.

⁷Available at <http://www.csls.ca/reports/csls2011-17appendixtables.pdf>. This is the implicit personal income tax rate by province, computed from income tax revenues as a share of income.

Table 1: Summary Statistics for Contracts Metadata

Variable	Obs	Mean	Std. Dev.	Min	Max
Private-Sector	32,402	0.480	0.500	0	1
Number of Employees	32,402	690.52	2886.66	0	170000
Year	32,402	2000.22	7.73	1986	2015
Duration (years)	32,402	2.600	1.170	0	20
Has COLA	32,402	0.282	0.450	0	1
Annual Wage Increase (%)	9,150	2.569	1.814	-7.561	19.836
Inflation	32,165	5.245	3.193	-5.930	29.986
Union Has Strike	32,402	0.033	0.178	0	1
Income Tax Rate (%)	24,910	22.390	1.448	16.11	25.62
Unemployment Rate (%)	29,200	5.086	3.545	1.08	49.92
Population (1000s)	29,471	5912.1	3753.8	96.9	11385
Employment (1000s)	29,471	213.51	168.8	0.2	696.7

Note: Summary Statistics (number of observations, mean, standard deviation, minimum, maximum) of contract characteristics and metadata matched to contracts. Data source: Employment and Social Development Canada.

From the Canadian Labor Force Survey, we also have access to a worker-level dataset for a sample of workers over time, coded by province and sector. In this data, besides province and sector, we have information on wages, and union status. This data is used in analyzing the effects of taxes and employment on wages below.

3 Measuring Rights and Obligations in Contracts

This section describes our methods for measuring features of union contracts from the texts of the agreements. We begin by describing our framework for estimating rights and obligations, and then describe the details of how we process the contracts. The data pipeline is an updated version of Ash et al. (2020).

3.1 Rights, Obligations, and Modal Verbs

There is a growing body of evidence that workers value unpriced amenities and control rights such as flexible scheduling and dignity at work (Chen et al., 2019; Dube et al., 2022b; Corradini et al., 2022). Unionized workers are assured of receiving these rights and amenities by the text in collective bargaining agreements. Firms and unions expend significant time, money, and energy in contract drafting, including the expensive expert services of labor lawyers to ensure that the text of these contracts are enforced (see Ashenfelter et al., 2013).

Our approach is to use contract text to measure the level of amenities and worker rights. There are a number of techniques that one could use to extract a measure of pro-worker amenities and contract rights (Gentzkow et al., 2017a; Grimmer et al., 2022; Ash and Hansen, 2023). We take a structural approach to text: a linguistically informed parser-based method combining legal knowledge and grammatical structure to extract pro-worker clauses that provide worker rights. In Section 4.6 below, we discuss the advantages of our method over other available methods, including dictionary-based methods, supervised machine learning, and large language models.

Our approach draws from classic ideas in legal theory that map linguistic indicators to associated legal rights and duties (Hohfeld, 1913; Markovich, 2020). We focus on modal verbs, which play a pivotal role in legal language. Modal verbs express a

Union-worker earnings are 1.5 times that of non-union workers, and tend to locate in the middle income tax brackets.

necessity or possibility: “it must be that X” or “it may that X”. Modal verbs can be either epistemic or deontic. Epistemic modal verbs have to do with what is entailed about the world (e.g. based on logical inference or evidence). In the terms of Kratzer (1991), modals have a “possible worlds” semantics, where words like “must” and “shall” imply compliance in all possible worlds, while words like “may” and “can” imply compliance in at least one possible world.

Deontic modal verbs (where deontic refers to “duty”) express necessity or possibility in the domain of social freedoms to act. In a legal context, they indicate whether an action complies with the written law. Consider the modal verbs can/may: A firm can do X in two senses. *Epistemically*, there exists at least one possible world in which the firm actually does X. *Deontically*, the firm may do X if there is at least one possible world where it does X and it remains compliant with legal or social norms. Similarly, must/will can carry different meanings. Epistemically, a firm must do X if, in all possible worlds, it actually does X. Deontically, a firm must do X if failing to do so would constitute a legal or normative violation. Deontic verbs can also be conditional on specific events. A regulatory rule might state, "If event A occurs, firms can do X" (permissive) or "If event A occurs, firms will do X" (obligatory).

Deontic modal verbs play a crucial role in legal language because they express permissions, obligations, and prohibitions. In doing so, these verbs help translate legal theorist Wesley Hohfeld’s conceptual framework, which classifies legal relations into categories such as "privilege," "right," "duty," and "no-right," into practical legal discourse. Specifically, permissions correspond closely to Hohfeld’s notion of privileges, while obligations reflect duties, and prohibitions delineate rights and no-rights (Hohfeld, 1913). In digital texts, such modal relationships can be extracted at scale using syntactic dependency parsing (e.g. Jurafsky and Martin, 2014).

3.2 Processing the Contracts

The contracts database arrived as scanned PDFs. The first step was to convert them to machine-readable text using OCR software. We excluded wage schedules, exhibits, appendices, and other miscellaneous materials. Next, we split the contracts into sections using a custom-built splitter based on the style of contract section headers. Within each section, we used a sentence tokenizer to split each section into a list of sentences. The resulting corpus consists of 980,909 contract sections (32.9 per

Figure 1: Contract Length is Proportional to Firm Size

Note: Binscatter plot of the logarithmized number of clauses in the contract (Y axis) against the logarithmized number of covered employees (X axis). Data source: Employment and Social Development Canada.

contract) and 10.8 million sentences (11.06 per section).

Each contract sentence is parsed using a syntactic dependency parser called spaCy (spacy.io). This package uses the ClearNLP dependency schema and has proven accuracy and efficiency relative to other parsers.⁸ The parser transforms sentences into parse trees, which represent the relations between words in a recursive hierarchical structure. The verb of a sentence is the root of the parse tree of a sentence, and arrows between words indicate which word depends on which, along with annotations indicating the type of dependency (e.g. subject, object, verb auxiliary, modifier).⁹ SpaCY classifies dependencies statistically, and is already trained on a large annotated dataset of parse trees. Appendix Figure A.2 shows the dependency parse for two example sentences.

Like most natural language processing applications, our framework simplifies and abstracts from much of the syntactic and semantic richness of a collective bargaining agreement. Just the length of these contracts is quite informative. Figure 1 shows that the number of clauses is tightly and proportionally related to the number of employees

⁸See <http://www.mathcs.emory.edu/~choi/doc/clear-dependency-2012.pdf>. SpaCy has been updated to a more recent version since we processed our corpus. Using the more recent version does not substantially change the empirical results.

⁹For a complete list of the types of dependencies see <https://universaldependencies.org/u/dep/>

covered. That provides some initial descriptive indication for a public-goods nature of contract clauses.

3.3 Clause Types

A foundational structure in linguistics is that most English sentences take the form “Subject-Verb-Object” (SVO). Subjects are the thing or person taking action or an attribute in the sentence, verbs are the action the subject is taking, and objects are what are being acted on by the verb. Therefore, in our framework each clause has 3 components: a subject, a verb, and an object.

First, for the subject, we identified four main personas in the contracts: worker, firm, manager, and union. The subject is assigned using a dictionary of synonyms to one of these four agent categories. Second, for verbs, we are most interested in deontic modal verb structures. The modal verb is distinguished as restrictive (*shall, will, must, should*) or permissive (*may, can*). Statements are tagged as negative (“shall not” rather than “shall”), and tagged as active (“shall hire”) or passive (“shall be hired”). Appendix Table A.2 provides tabulations for the most frequent subjects, modals, and verbs encountered in our data set.

We identify a handful of special verbs that appear often in the contracts and delineate obligations and rights: Obligation Verbs (be required, be expected, be compelled, be obliged, be obligated, have to, ought to), Prohibition Verbs (be prohibited, be forbidden, be banned, be barred, be restricted, be proscribed), Permission Verbs (be allowed, be permitted, be authorized), and Rights Verbs (e.g. receive, gain, earn).¹⁰ We define Action Verbs as all non-special active-tense words, including “be” by itself. Passive Verbs are all non-special passive-tense verbs.

Now, we use these grammatical features to assign statements to one of four types of contract statements (or “other”). The formal requirements, plus some examples, are included in Appendix Table A.3. An *Obligation* requires that the subject perform an action or set of actions. A *Prohibition* requires that the subject not perform an action or set of actions. A *Permission* gives the subject permission or authority over

¹⁰Receive, gain, and earn, are “active” rights verbs in the sense that “worker shall receive” is a right. We also have a long list of “passive” rights verbs, where for example “workers shall be entitled” is considered a right. These passive rights verbs include: entitled, given, offered, reimbursed, paid, granted, provided, compensated, guaranteed, hired, trained, supplied, protected, allowed, covered, informed, notified, selected, awarded. We experimented with a longer list of entitlement verbs and got similar results.

Table 2: Summary Statistics: What do Union Contracts Consist of?

Agent	Obligations		Rights		Permissions		Prohibitions		Total	
	Count	%	Count	%	Count	%	Count	%	Count	%
Worker	666021	20.9	730327	22.9	266278	8.4	99795	3.1	1,762,421	55.3

Note: Counts and frequencies (%) of clause types in the contracts corpus, by agent (rows) and statement type (columns). Data source: Employment and Social Development Canada.

an action or set of actions. A *Right* gives the subject a right or entitlement.

The grammatical parse approach works well because it precisely identifies the critical structures in the sentence while allowing for flexibility in word order. For example, a dictionary approach for worker rights based on patterns like “employees shall receive” would miss variants like “employees shall always receive.” In Ash et al. (2020), we use hand annotation of these phrases to show high precision of these assignments. Section 4.6 below provides a discussion of the advantages of this method relative to alternatives like dictionary matching, embeddings, and supervised learning.

We extract each statement type for each agent. Appendix Table A.4 shows the most frequent examples for the matrix of agents and statement types. Table 2 reports summary statistics on the overall frequencies. Clauses mostly concern workers (55.3%) and the firm (30.5%), rather than the union (11.7%) or managers (2.5%). In terms of statement types, a majority are obligations (54.4%), followed by rights (26.2%), permissions (14.1%), and prohibitions (5.3%). The three most important agent×clause assignments are firm obligations (24.7%), worker rights (22.9%), and worker obligations (20.9%). Notably, there are very few firm rights (0.9%). Overall, then, union contracts mainly do three things: (1) impose obligations on workers, (2) impose obligations on firms, and (3) grant rights to workers.

Appendix Figure A.3 provides a descriptive look into the legal content of these union contracts over time. We plot for each year the average number of rights and obligations by contract, for workers and firms, respectively. We can see that firm obligations, worker rights, and worker obligations increase steadily until 2005. Since then, they are rather constant. The number of firm rights remains small throughout the period.

4 Validation of Worker Rights Clauses

The set of clauses that we call worker rights capture workplace amenities and worker authority over the workplace. They are clauses where a worker subject (e.g. “worker”, “employee”) is attached to a verb phrase indicating entitlement to some amenity or control right (see Table A.3). Those verb phrases include a non-negated verb structure with a rights verb (e.g., “employees will receive”, “workers shall be paid”) or a negated modal attached to an obligation verb (e.g. “workers may not be required”, “employees should not be expected”). These phrase templates and rules were developed through application of legal knowledge to close reading of the clause texts, careful inspection of the associated syntactic parse outputs, and checking of the rule-based category assignments.

This section provides supporting material to help validate this procedure for identifying worker rights and our interpretation of rights as containing amenities and authority. We show a combination of qualitative and quantitative evidence for this interpretation. We also compare our measure to some alternative text-based measures of amenities proposed in the literature.

4.1 Qualitative Inspection of Topics Covered by Worker Rights

We first provide a qualitative validation of rights by illustration and inspection of the NLP pipeline outputs. A sample of 16 worker rights from the whole corpus are listed in Appendix Table A.6. As intended, these clauses reflect the assignment of various rights or benefits to workers. For example, limits on extended work hours (1, 3, 4, 5), requirements for timely payments (2), provisions around missing work or holidays (6, 7, 9, 11, 16), life insurance benefits (10), or seniority (13, 14). Some rights are very specific, such as employees being elected to political office being entitled to a leave of absence (15).

To move forward and provide a more comprehensive view beyond specific examples, we apply NLP tools to group the rights into topics. First, we take each sentence and vectorize them using a transformer-based sentence encoder (Reimers and Gurevych, 2019). These 768-dimensional vectors encode context-sensitive semantic information based on a pre-training task predicting logical relationships between sentences. The resulting sentence embeddings have a spatial representation, where the location in the vector space is semantically meaningful. That is, sentences that are

semantically similar will tend to be spatially proximate in the space. And regions of high density in the space correspond to clusters of semantically related clauses. In line with that, we construct topics using k-means clustering applied to the sentence embeddings, with separate clusters constructed for each clause type – in particular, within the set of worker rights. These clusters can then be understood as prototypes representing the semantic distribution of rights.

Like popular topic model algorithms such as Latent Dirichlet Allocation (LDA) (Blei et al., 2003; Hansen et al., 2017), our clustering method learns topics inductively from the corpus texts, without labels. There are three main advantages of clustered embeddings over LDA for our context. First, the method is word-embedding-based, rather than bag-of-words-based, such that the meanings of words are interdependent, rather than independent. For example, our method registers that “employee” and “worker” are synonyms, whereas LDA treats those words as independent. Second, the method learns context-sensitive representations. For example, the word “lunch” can have a different meaning in clauses about worker lunch breaks, versus clauses about the lunch shift for restaurant workers. LDA does not make such a distinction. Third, our clustering method assigns each individual clause to a single topic, rather than a distribution across topics. That results in a simpler dataset, and makes more sense for short documents (single sentences) rather than long documents.

Given that these topics are for descriptive traction and interpretability, we take a practical approach in tuning the clustering algorithm. After some experimentation, we settled on 30 topics.¹¹ For further interpretability, we further manually aggregated the 30 “narrow” topics into seven more interpretable “broad” topics: Family Issues, Health & Well-Being, Payments, Scheduling, Seniority, Vacations, and Work Termination.¹²

The 30 topics associated with worker rights are listed and annotated in Table 3. Each row corresponds to a topic and we have four columns. The first column (“Topic Label”) provides a hand-annotated topic label. Skimming through the list, we see intuitive sets of amenities, benefits, and provisions describing workplace rules and requirements. The third column (“Frequency”) gives the proportion of rights clauses associated to that topic. It indicates that rights clauses are relatively evenly

¹¹In the k -means algorithm, we selected 32 clusters. We dropped 2 outlier topics that were about a specific occupation (teachers).

¹²See Appendix Table A.9 for the match between narrow and broad topics. Appendix Figure A.4 shows the time series of the broad worker rights topic shares over time. They are quite stable.

Table 3: Topics Describing Contracted Worker Rights

Topic Label	Sim to Wages	Frequency	Topic Summary
Grievance & Discipline	0.1590	0.031	The clauses provide workers with rights related to disciplinary actions, grievance procedures, and representation, ensuring transparency, due process, and the ability to challenge or appeal employer decisions.
Job Security	0.1677	0.03	The clauses provide workers with rights related to job security and stability, including provisions for notification and options in the event of workforce adjustments, opportunities for training or retraining, recall rights for seasonal or displaced employees, and protections for seniority and pay rate in cases of job changes or redundancies.
Notice Requirements	0.1750	0.027	The clauses provide workers with rights to receive advance notice regarding absences, layoffs, job vacancies, shutdowns, and meetings, ensuring they have adequate time to prepare for changes in their employment status or work conditions.
Recall	0.1768	0.032	The clauses provide rights related to job security and recall for workers who have been laid off, including options to accept vacant positions, refuse temporary recalls without penalty, and priority for rehiring in their former or equivalent positions if they become available.
Jury Duty	0.1779	0.009	The clauses provide rights to workers for compensation or pay adjustments when they are required to serve on jury duty or appear in court as witnesses, ensuring they are not financially disadvantaged for fulfilling these civic duties.
Personnel Records	0.1789	0.024	The clauses provide workers with the right to access, copy, and be informed about their personal and employment-related documents, including personnel files, job assignments, employment letters, disciplinary documents, and performance reviews.
Seniority & Promotion	0.1792	0.03	The clauses are granting workers rights related to job preference, promotion, and transfer based on seniority, qualifications, and experience.
Parental Leave	0.1838	0.027	The clauses provide rights related to maternity and parental leave, including paid and unpaid leave, allowances, and special considerations for employees who are pregnant or adopting a child.
Probation Period	0.1838	0.015	The clauses provide rights related to the recognition and crediting of probationary periods for employees, including extensions, credit for previous service, and exemptions from additional probationary periods for certain transfers or promotions.
Bereavement Leave	0.1895	0.028	The clauses provide workers with bereavement leave, allowing them time off, often with pay, to grieve and attend funerals following the death of a close relative or family member.
Part-Time	0.2014	0.023	The clauses are providing rights related to compensation, work hours, seniority, and benefits for part-time employees.
Work Hours	0.2045	0.058	The clauses provide workers with rights to guaranteed minimum pay for short-notice work, overtime compensation, pay for additional duties or hours beyond their regular schedule, and specific pay rates for work under certain conditions or times.
Reimbursements	0.2051	0.022	The clauses provide workers with rights to compensation and allowances for time spent and expenses incurred due to work-related travel, delays, and use of personal vehicles for work purposes.
Breaks	0.2065	0.013	The clauses are granting workers the right to paid rest and wash breaks during their work shifts.
Shift Premiums	0.2070	0.025	The clauses are providing workers with additional compensation for working under specific conditions, such as shift differentials, premium pay for weekends or consecutive shifts, and pay increases for assuming additional responsibilities or working in particular locations.

... continued on next page...

Table 3 (cont.): Topics Describing Contracted Worker Rights

Topic Label	Sim to Wages	Frequency	Topic Summary
Termination	0.2076	0.026	The clauses are providing workers with rights to various forms of compensation upon termination of employment, including severance pay, payment for unused vacation, and other forms of separation payments.
Leaves of Absence	0.2100	0.039	The clauses provide workers with the right to take leaves of absence for union activities, public service, education, retraining, and other approved reasons, with varying conditions regarding pay and benefits.
Overtime	0.21094	0.026	The clauses provide workers with rights to receive enhanced compensation and specific benefits for working overtime, including higher pay rates for overtime hours, compensation for cancelled overtime, meal reimbursements, and shift change notifications.
Position Classification	0.2115	0.036	The clauses are providing workers with rights to receive pay adjustments or increases when they take on duties in higher paying classifications, substitute in higher paying roles, transfer to new positions with higher salary scales, or are temporarily appointed to positions of a higher pay grade.
Workplace Safety	0.2118	0.054	The clauses provide workers with rights related to workplace safety, health protection, and compensation in case of job loss due to technological changes, as well as opportunities for union engagement and training on safety procedures.
Meals	0.2126	0.015	The clauses are granting workers rights related to receiving meal allowances, paid or unpaid meal breaks, and compensation related to meal times during or adjacent to their work shifts.
Workplace Injuries	0.2131	0.024	The clauses provide workers with rights to compensation and benefits in cases of injury, illness, or accidents occurring in the course of employment, including coverage for lost wages, protection against costs for damaged equipment, and provisions for receiving full or partial pay under specific conditions.
Scheduling	0.2146	0.03	The clauses provide workers with rights related to scheduling flexibility, compensation for working during non-standard hours or days off, and benefits during absences or layoffs.
Seniority-Based Benefits	0.2194	0.039	The clauses provide workers with rights related to pro-rated benefits, eligibility for allowances based on employment duration, credit for service and seniority during leaves, cost-sharing for benefits, and entitlements based on continuous service, including adjustments in pay and long-term disability plans.
Sick Leave	0.2237	0.025	The clauses provide workers with rights related to receiving pay or benefits during periods of illness, injury, or medical leave, ensuring financial stability during times they are unable to work due to health reasons.
Holiday Pay	0.2335	0.037	The clauses provide workers with rights to paid holidays, additional compensation for working on holidays, and adjustments to vacation schedules or pay in the event a holiday falls during their vacation period.
Holiday Work Pay	0.2393	0.026	The clauses provide workers with enhanced compensation for working on holidays, weekends, or their scheduled days off, including provisions for part-time and temporary employees.
Vacations	0.2405	0.045	The clauses are granting workers rights related to vacation entitlements, including the timing, duration, and pay during their vacation periods.
Seniority-Based Vacation	0.2411	0.038	The clauses are granting workers vacation benefits and time off based on their length of service and seniority.
Payment Rules	0.2414	0.051	The clauses are giving workers rights related to the timing, frequency, and accuracy of their wage payments.

Note: List of topics describing worker rights clauses. “Topic Label” is a human-provided label based on the contained clauses and summary. “Sim to Wages” is the sorting variable and scores the topics by their similarity to priced amenities (see details in text). “Frequency” is the share of worker rights on that topic. Topic Summary Label is a GPT-4-generated summary of the topic based on a sample of associated clauses.

distributed across topics, with the smallest topic (“Jury Duty”) containing 1% of the rights clauses, and the largest topic (“Work Hours”) comprising 6% of the rights clauses.

The fourth column gives a GPT-4-generated summary of the topic. That was produced by providing a random sample of clauses and prompting GPT-4 to summarize the associated rights being provided. We can see that the topics are intuitively related to amenities at work, including holidays, sick leave, and payments, as well as measures of workplace decision-making, such as scheduling, seniority, and termination. That provides some qualitative support of our measure of text-based measure capturing worker rights and the associated interpretation as comprising amenities and assignments of control rights.

Table 3 is sorted by the second column, “Sim to Wages.” This score is motivated by a key conceptual distinction in the space of worker rights – of whether or not a right is a cash-like benefit that is substitutable with wages. These “priced” amenities can be distinguished from “unpriced” control rights or authority, the benefits of which are more subjective and may vary from one employee to another. To integrate the notion of amenities and control rights into our data, we score each narrow topic as indicating a priced amenity. We start with the codebook from U.S. Bureau of Labor Statistics’ National Compensation Survey. That codebook provides a detailed list of employment benefits and amenities that impose a quantifiable cost to employers – that is, they are priced. We extract and parse this list of priced amenities, phrased as they would appear in contracts.¹³ We then construct simulated priced-amenity clauses as “Employees shall have ...”, followed by each of these priced-amenity phrases. We compute sentence embedding vectors for each simulated priced-amenity clause, just as we do for the clauses in the contracts corpus. Finally, we compute “Sim to Wages” as the proximity of each clause embedding to each topic cluster centroid. Topics that are closest to the list of priced-amenity clauses, shown at the bottom of Table 3 (e.g. payments, vacations, and sick leave), are the most substitutable with wages and tend to reflect amenities and benefits. Topics that are furthest from the list, shown at the top of the table (e.g. grievance procedures, job security, and recall), are the least substitutable with wages and tend to set rules and assign control rights.

¹³The full list is: incentive-based pay, a commission, a production bonus, a piece rate, a cost-of-living allowance, hazard pay, a uniform allowance, a tool allowance, free room and board, subsidized room and board, paid vacation leave, paid holiday leave, paid sick leave, paid personal leave, overtime pay, shift differential pay life insurance, health insurance, disability insurance, retirement benefits.

Appendix C lists the rights clauses associated with each topic which were used to construct the GPT-4 summaries. Even when they are about amenities, the clauses often reflect limits or conditions on the amenity. Still, because management reserve rights, these conditional clauses are expanding worker rights rather than limiting them.

4.2 Validation with Pairwise Comparisons of Clauses

While the example worker rights clauses discussed above can be fairly interpreted as rights or amenities that benefit workers, it could be that such an interpretation would also fairly extend to many clauses from the other clause types. It is quite difficult to set an objective threshold for whether a given clause is pro-worker or not. That is a subjective determination that is difficult to calibrate, so human annotations of a sample of contract clauses as pro-worker or not might be of limited value.

A much easier annotation task is to take pairs of clauses and decide which of the two is more favorable to workers. For example, the clause “Employees who retire as well as current retirees and survivors will be provided with Life Insurance in the amount of \$6,000”, versus “If the parties mutually agree, the Company may hire temporary employees for short term periods not longer than 30 work days for non-routine work or special projects”. The second clause (a firm permission) is not clearly favoring or disfavoring workers on its own. But a pairwise comparison is much easier: the second clause is clearly less beneficial to workers than the first clause (a worker right).

A downside of pairwise comparisons is that it requires more annotation data. Say we want to get a pro-worker score for 100 clauses for each of the 16 clause types (4 agents \times 4 provisions). That adds up to 1600 annotations. In contrast, with pairwise comparisons we have $16 \times 15 = 240$ across-clause-type pairs; or 24,000 annotations to get 100 annotations for each type pair.

That is quite costly in terms of human annotation resources. Fortunately, pairwise comparisons in terms of pro-worker clauses is an easy enough task that the newest generation of human-aligned large language models (LLMs) are “smart enough” to reliably make such comparisons. We validate and implement that approach here.

We use OpenAI’s GPT-4o model (`gpt-4o-2024-08-06`) with the system prompt, "You are a helpful legal assistant." The user prompt is, "Which of these sentences

Table 4: LLM Validation of Worker Rights as Favoring Workers

Clause Type	Clause Frequency (%)	Pro-Worker Frequency (%)
Worker Right	22.9	79.7
Worker Permission	8.4	67.3
Union Right	2.1	65.7
Firm Obligation	24.7	60.7
Manager Right	0.2	58.4
Worker Obligation	20.9	53.1
Manager Obligation	1.7	44.5
Union Permission	2.0	43.2
Worker Prohibition	3.1	41.6
Manager Prohibition	0.1	38.8
Firm Prohibition	1.5	36.5
Firm Permission	3.4	35.5
Manager Permission	0.4	34.3
Union Obligation	7.0	31.3
Union Prohibition	0.6	28.3
Firm Right	0.9	28.2

Note: Statistics from pairwise comparisons of clause types with GPT-4o, as described in the text. Rows indicate clause types. Second column gives the frequency of that clause in the corpus; third column gives the proportion of pairwise comparisons where that category’s clause is annotated as more beneficial to workers than the paired clause from another category. Sorted by third column. Data source: Employment and Social Development Canada.

from a union collective bargaining agreement is more likely to be interpreted as an entitlement, benefit, or amenity for workers? Answer ‘Definitely 1’, ‘Probably 1’, ‘Probably 2’, ‘Definitely 2’, or ‘Neither’. 1. [sentence 1]. 2. [sentence 2.]” For the input sentences, we input a randomly sampled pair from two different clause types.

First, we validated that this LLM method reproduces human annotations of the pairwise comparisons. For the example pair above, it picks the first clause on life insurance benefits. Consider the following more difficult pair: (1) “It is understood that upon thirty (30) calendar days written notice, either the supervisor or employee may terminate such an agreement.”; (2) “The two members thus appointed shall confer jointly in an endeavour to select a third member who shall be the chair of the board.” In that case, GPT-4o quite reasonably answers, “Neither”. We compared the GPT-4o output to 300 human-labeled pairs, finding an agreement rate of 65.3%. More relevant to our purposes, the agreement rate is 83.3% when one of the clauses in a pair is a worker right.

We then implement this automated annotation procedure for a random sample of 24,000 across-clause-type pairs of clauses in the labor union contracts corpus. Based on this sample, we compute the predicted probability that each clause type is more pro-worker than all other clause types.

The results of that exercise are shown in Table 4. According to the LLM pairwise annotations, the clauses that we label as worker rights are substantially more pro-worker than the other categories. Specifically, they are more pro-worker 80% of the time, far higher than the second-ranked category of worker permissions (67%). The other common categories have even lower percentages: firm obligations and worker obligations are considered relatively pro-worker 61% and 53% of the time, respectively. Firm rights are classified as pro-worker just 28% of the time, making them the least likely to be pro-worker.

4.3 Validation Against Survey Data on Pro-Worker Practices

Next we validate our measure of worker rights by relating it to metadata. Specifically, we show that it is predictive of actual pro-worker human resources practices in firms. Our data source for these practices is the World Management Survey (Bloom et al., 2012). We were able to link the survey responses from 125 Canadian manufacturing firms to our labor contracts dataset.

Among many other things, this survey asks about human resource management practices. Following Bloom and Van Reenen (2010), we constructed a seven-point index for pro-worker HR practices as follows. Items that increase our index are “managers care about workers”, “promotes good workers”, and “employees are valued”. Items that decrease the index are “focus on top talent”, “incentives”, and “fire poor performers”. The summed index ranges from zero to six. We then standardize the pro-worker HR index and compare it to our text-based measure of pro-worker rights and other clause types.

A coefficient plot of our worker right measure, regressed against the pro-worker index, is shown in Figure 2. We see that worker rights are an outlier among the clause types in being highly correlated with the index, with high statistical significance. In contrast, the other two frequent clause types (worker obligations and firm obligations), are negatively related to the index (see also Appendix Figure A.5). Overall, that is consistent with our interpretation of worker rights as measuring pro-worker amenities and worker autonomy. The other contract clauses do not have such an interpretation.¹⁴

¹⁴In Appendix Table A.12, we show that the workers’ rights that are the least “wage like” – that is, ranking lowest on text similarity to priced amenities – are most predictive of the pro-worker HR index. That is, workplace rules and control rights are more indicative of pro-worker practices than

Figure 2: Clause Types and Pro-Worker HR Practices

Note: Figure presents coefficients and 95% confidence intervals of regression of contract clause types on index for Pro-Worker HR Practices. Each coefficient is from a separate OLS regression. Outcome: Clause type share (number of clauses of type in question over the number of all clauses). Treatment: Standardized index of Pro-Worker HR Practices, defined as sum of approval rates to six statements about worker practices; it increases in “managers care about workers”, “promotes good workers”, and “employees are valued,” and decreases in “focus on top talent”, “incentives”, and “fire poor performers”. Controls: None. Inference: Heteroscedasticity-robust standard errors. Data sources: Employment and Social Development Canada, World Management Survey (Bloom et al., 2012).

4.4 Comparison with Alternative Supervised-Learning-Based Method

An alternative approach to measuring pro-worker amenities in labor union contracts is to identify text features that are associated with higher employment at a firm. That approach is motivated by the idea that higher employment, controlling for wages, reflects higher worker utility at the firm, as in recent models of monopsonistic labor markets with amenities (Bagger and Lentz, 2019; Lamadon et al., 2022; Volpe, 2024). Our approach is based on Lagos (2020), who extracts contract features that predict firm-specific voluntary transitions. In a variant of this method designed to identify pro-women amenities, Corradini et al. (2022) predict higher female employment with contract text features, adjusting for gender wage premia.

We construct an “Excess Employment Amenity Measure” as follows. We vectorize the contracts using LDA to produce topic shares \vec{L} . We run OLS to predict higher firm employment N based on the contract features \vec{L} , adjusting for wages. Because we don’t observe firm-level wages, we impute the province-sector-year wage from the LFS. We also adjust for province-sector and sector-year fixed effects. Results are similar, but less precise, if we also include firm fixed effects.

We now have the contract-predicted employment $\hat{N}(\vec{L})$ from the fitted OLS regression. The regression model extracts contract topics that contribute to higher contract-covered employment, conditional on wages — that is, contract terms that allow the firm to have higher employment than competitors paying similar wages.

Appendix Figure A.6 provides the main comparison for this excess employment amenity measure (text-predicted firm size). The excess-employment index is significantly positively correlated with our parser-based measure of worker rights. However, it is not correlated with the pro-worker HR practices index from Bloom and Van Reenen (2010). That gives some additional support for using our parser-based measure.

4.5 Case Study: Canadian Auto Workers

As a final descriptive validation, we zoom in on the labor contracts between the Canadian Auto Workers (CAW, later Unifor) and Chrysler. Historically, these contracts had special significance because of the "pattern bargaining" norm in the Canadian

more wage-like amenities.

Figure 3: Case Study: Pay and Rights During the 2005 Auto Industry Crisis

Note: Time series of features of the Chrysler-CAW contract, 1996 to 2012. The series includes parsed worker rights (red), average of other clauses besides worker rights (green), and contracted wage increases (blue). The dashed vertical line in 2005 indicated the year of the auto industry crises, the dashed vertical line in 2008 indicates the year of the financial crisis.

auto industry, where contracts across Ford, General Motors, and Chrysler tend to exhibit similar characteristics. We focus on the 2005 auto industry crisis, a period where post-WTO imports and escalating oil prices exerted substantial competitive pressures on Canadian automakers. CAW had to make substantial concessions, not just with wages but also in highly valued workers' rights.

Reports at the time speak to the special turning point in these union negotiations. The New York Times reported that the contracts were "the most modest ever signed by the C.A.W." CAW President Buzz Hargrove described the negotiations as "totally unprecedented . . . there was 'no business as usual' in this round of bargaining". He wrote that "The companies started bargaining by demanding big concessions: like replacing wage increases with lump sums, abandoning COLA (even for pensioners), 10% co-pays on prescriptions, and giving up a week of paid time off per year." That is, there were pressures on both wages and rights.

We use this setting to undertake a more targeted validation of our NLP method. We expect that contract amenities, as measured by worker rights, will decrease in the contract negotiated in 2005. Figure 3 shows a time series of these rights across

Chrysler-CAW contracts (red diamonds series). As expected, rights drop precipitously in the 2005 contract. Similarly, contracted wage increases (in blue circles) also decrease in that round. In contrast, other contract features (the average of other clause types besides worker rights, in green triangles) do not change much.

The divergence between wages and contract language in the 2008 bargain is also consistent the interpretation of worker rights as an amenity. In May 2008, there was a historically high exchange rate between Canadian and U.S. dollars, making Canadian auto wages highly non-competitive with U.S. worker wages. Thus the auto companies demanded, and received, no wage increases, and conceded a variety of contractual rights (including no two-tier contracts and keeping a plant open) in response. We observe those trends directly in our time series: a further reduction in contracted wage increases (blue), yet a rebound in rights (red).

Overall, this CAW case study provides additional grounding for our approach. Our parser-based measure of worker rights behaves like a valuable amenity that has to be traded off under significant bargaining pressure. Hence, we can use counts over rights clauses as a well-grounded measure in our subsequent empirical analysis.

4.6 Discussion: Alternative Methods to Measure Worker Rights

Our structural parser-based approach to language is one of several methods that can, in principle, be employed to extract worker rights from contract texts, or to measure worker rights more generally (Gentzkow et al., 2017a; Ash and Hansen, 2023). In the following, we discuss the benefits of the parser-based based approach relative to some potential alternatives.

A core assumption behind our approach is that small differences in complex language dependencies can significantly alter the legal content of a contract. For example, take these three clauses: “Workers must work from home”, “Workers may work from home”, “Workers may not work from home”. They are all very close to each other in the standard language distance metrics, including those computed using state-of-the-art sentence embeddings (e.g. Reimers and Gurevych, 2019). Our grammar-based method identifies the critical verb modifiers in terms of modality (may vs. must) and negation (may vs. may not). Unlike a token-based or embedding-based approach, the structural grammar parse more faithfully captures the information in legal text that matters for judges, arbitrators, and lawyers.

To elaborate, take as a first alternative a dictionary approach, which would count rights-related terms in the contracts. For example, “health benefits” likely favors workers. A problem with this approach is that it is difficult to prepare a sufficiently complete list of pro-worker terms. And even with such terms, dictionaries miss important context. Some obvious examples include “new employees do not receive health benefits”, or “only managers are entitled to health benefits”. Our parser-based approach addresses the issue of context and negation from dictionaries, as it brings in the relationships between agents and actions through syntax.

Second, one could use supervised learning in which humans annotate a sample of clauses as pro-worker or granting rights, and then train a classifier to scale up to the whole dataset. A roadblock to this approach is that it is not possible to label most observed clauses as pro-worker or not. Even labor lawyers are hesitant to do that except for a few special types of clauses. Further, even if making those labels was possible in practice, statistical models would still require a very large dataset of annotations to learn that small linguistic changes can have large legal implications, especially for edge cases that may be rare in the existing corpus. Our approach addresses the issues with human annotations by focusing on specific syntactic features that have a structural legal meaning. It provides a generalizable rule to broadly label sentences without supervised learning.

Third, one could use supervised learning to scale text that is predictive of a meta-data variable indicating a pro-worker orientation. An example of this approach discussed above is Lagos (2024), who extracts contract text features that are predictive of firm size. A downside of this approach is that one cannot fully control for the fact that employment and other labor market factors are endogenously and jointly determined with the contract characteristics. Hence, such an approach faces identification problems similar to those found in the literature on self-selection (Heckman and Honore, 1990). In turn, the regression model will load on substantial confounding variation which may not reflect worker utility. Our parser approach, unlike the firm size prediction approach, has no supervised training that may introduce confounders. The relevant predictors are strictly and manually regularized with legal knowledge.

A fourth approach would be to use a large language model (LLM) to annotate clauses as being favorable to workers or not (Ash et al., 2025). LLMs are a powerful and promising approach. And as described above, we use both BERT-based and GPT-based models in different ways to support our analysis. But at present, those

methods do not provide a substitute for a legally informed structural approach. For example, while a fine-tuned BERT could be used to get good test-set performance on the aforementioned supervised learning approaches, it would not address the problems of obtaining well-calibrated human annotations or the presence of unobserved confounders driving the predictions.

Aligned generative LLMs like GPT could improve on BERT by drawing on implicit legal expertise learned from their training corpus and during post-training alignment. But the current generation of LLMs are general-purpose tools that have only a basic understanding of Canadian labor law, or law more generally (e.g. Dahl et al., 2024). Beyond human annotations used for model alignment, these model representations are not informed by real-world inputs or outputs – that is, factors outside the text – that are first-order for contract interpretation and design. As Vafa et al. (2024) point out, LLMs do not have a structural model of the world – that is, they do not correctly infer the structure of deterministic systems (e.g. logic or navigation). Hence they often give misleading outputs for valid inputs.¹⁵ Development of language models that integrate structured knowledge – for example through information retrieval, grammar-constrained decoding, or verifiable reasoning – is ongoing and promising. But for now our structural grammar-based approach is preferred.

The contrast between LLMs and our approach is an instance of a much larger, foundational, debate in linguistics. Should researchers focus on behavioral regularities in observed language use (Norvig, 2012) or formal grammars describing the space of possible linguistic constructs (Chomsky, 1959)? Unlike LLM-based methods that do not have an internal “world model” of legal reasoning (Vafa et al., 2024), our measure is built around a structural model of contract writing. That makes our approach transparent, reproducible, and interpretable by humans.

Beyond these NLP alternatives, a more foundational question is: Why use text at all to measure worker rights? That is, why not measure wages and maybe some well-defined benefits like health insurance? A first answer is that: Many things that workers care about are not wages or pecuniary benefits. Workers value unpriced amenities and control rights, such as flexible scheduling and dignity at work (Dube et al., 2022b; Corradini et al., 2022). Consistent with that, the contract terms clearly

¹⁵A simple clause example that “tricks” recent versions of ChatGPT into identifying a worker right is: “School principals are cherished workers and are entitled to 6 weeks of vacation annually.” The trick is that principals are managers, not workers. In our framework, this clause would properly be labeled as a management right, rather than a worker right.

matter to the parties to an agreement. Firms and unions expend significant time, money, and energy in contract drafting, including the expensive expert services of labor lawyers (see Ashenfelter et al., 2013).

Another non-text alternative would be to measure behavioral responses like strikes or litigation. Those might seem like more meaningful, high-stakes measures of the quality of the worker-firm relationship. But we cannot use them because such outcomes are rare – and more specifically, they occur only out of equilibrium. A goal of a well-designed contract is to reduce conflict, and hence the effects of contract terms on strikes, litigation, and related conflict outcomes are based upon a selected sample of firms, and face the classic problem of sample-selection bias (see e.g. Heckman and Honore, 1990).

In turn, contracts shape expectations and outcomes not just through wages, employment, strikes, and other observable variables. The requirements articulated in the text, written through a costly negotiation and drafting process, and with the goal of preventing ex post conflict, have independent importance. Yet the scope of a clause – i.e., the set of states where it applies – is not obvious, and often not explicitly demarcated. That requires more information to interpret, either by lawyers or AI. For all these reasons, we focus on language as an outcome, rather than a treatment.

5 Empirical Analysis

We are interested in measuring how observed contract terms in Canadian collective bargaining agreements respond to changes in local economic conditions. Section 5.1 outlines the empirical approach. Then we look at how provincial tax rates (Section 5.2), or changes in the local employment rate (Section 5.3), affect worker rights.¹⁶

5.1 Empirical Approach

The dataset is built at the level of the contract adopted in province p , sector s , firm i , and effective year t . For each contract, we have a set of outcomes represented by y_{psit} , which refer to the various clause types. In the main specification, we look at

¹⁶We also assessed the effects of local political control (local government controlled by the New Democratic Party, Canada’s labor party), and local sectoral competition (more establishments in an industry in a province, motivated by Aidt and Sena (2005)) on worker rights, without finding conclusive results.

the share of each clause type – that is, the number clauses of a given type divided by the total number of statements in the contract. In robustness checks, we report other specifications for the outcome variable.

We focus on two treatment variables z_{pst} . First, we have a measure of the labor income tax rate that varies at the province by year level. This labor income tax rate, noted as $z_{pst}^{tax} = \log(\text{tax})$, is defined as the (log) province-by-year implicit personal income tax rate computed from income tax revenues as a share of income.

Second, we use local employment rate varying at the province by sector by year level. We calculate it as a leave-one-out employment rate, in which the employment rate in a given province, year, and sector is replaced by the average of the employment rates in that province and year in all other sectors, noted as $z_{pst}^{emp} = \frac{\sum_{i \neq s, i \in S_{pt}} \log(\text{employment}_{pit} / \text{pop}_{pt})}{|S_{pt}| - 1}$, where S_{pt} is the set of sectors in a province-year. This leave-one-out employment rate variable is a proxy for the outside option of workers during the bargaining process. For both tax and employment, we use a continuous measure for panel regressions, and a discretized version for event study regressions.

For each of our treatment variables, we use a linear model

$$y_{psit} = \rho z_{pst} + \alpha_{ps} + \alpha_{st} + X'_{psit} \beta + \epsilon_{psit}, \quad (1)$$

with the components described as follows. First, y_{psit} and z_{pst} are outcomes and explanatory variables of interest, respectively, with ρ giving the corresponding OLS coefficients. Depending on the specification and associated assumptions, the estimand $\hat{\rho}$ may or may not estimate a causal relationship. Second, α_{ps} refers to province-by-sector fixed effects, and α_{st} refers to sector-by-year fixed effects. Third, X_{psit} may include additional fixed effects (e.g., for union or company), or additional time-varying controls, for use in assessing robustness of $\hat{\rho}$. Finally, ϵ_{psit} is an error term. Standard errors are clustered by province-sector. In robustness checks, we show that the main results are robust to clustering by province.

Identification of this specification is threatened by omitted variables that are correlated with both z_{pst} and y_{psit} . We first note that because contract renegotiation is generally on a pre-specified timeline, the scope for endogenous timing of contract re-negotiation is limited. Nonetheless, taxes could be correlated with a variety of other policies, or political environments that may also influence union negotiations. In Appendix Table A.10, we show that there are no effects on the sample composition

as indicated by firm entries and firm exists, and no effects on other contract features such as the presence of a COLA clause. We also control for New Democratic Party (NDP) control as well as a range of pro-union labor laws to mitigate concerns about endogenous treatment timing. Similarly, our proxy for outside options may be correlated with own-firm or same-industry labor demand. Thus, we explore specifications where we control for own province-sector-year employment rate in addition to the leave-one-out employment shock.

To assess the plausibility of the parallel trends assumption, we also estimate an event study model. We define an event as the largest labor tax (employment) increase in each province. Decreases are defined analogously, and all events are limited to the middle years in the sample to ensure a sufficiently large number of pre- and post event years.¹⁷ To account for heterogeneous treatment effects in the presence of staggered treatment timing (Sun and Abraham, 2021), we implement the event study estimator by Callaway and Sant’Anna (2021) using not-yet treated units as controls.¹⁸ We test for parallel trends by looking for evidence of pre-trends, and by computing the joint significance of the pre-period coefficients.

To further account for potential confounders of tax changes, we implement an instrumental variable strategy inspired by Gruber and Saez (2002) and Akcigit et al. (2021). We isolate exogenous changes in the *province* income tax that arise due to changes in *federal* tax rates, driven by associated tax deductions and tax credits. The overall tax rate can be expressed as $z_{pt} = \log(\tau_{p,t}(\bar{y}_{p,t}) + \tau_{\text{federal},t}(\bar{y}_{p,t}))$, with $\tau_{p,t}(\bar{y}_{p,t})$ defining the province level tax rate in province p and year t that applies to the average income in that province and year, and $\tau_{\text{federal},t}(\bar{y}_{p,t})$ defining the federal level tax rate in year t that applies to the average income in province p and year t . Using Kevin Milligan’s Canadian Tax and Credit Simulator (CTaCS) (Milligan, 2019), we calculate our instrumented tax rate for which we lag income and province level tax rates by k years, with $k \in \{1, 3\}$, as follows:

$$z_{pt}^{\text{IV}} = \log(\tau_{p,t-k}(\bar{y}_{p,t-k}) + \tau_{\text{federal},t}(\bar{y}_{p,t-k}))$$

¹⁷Specifically, we define an event as the largest labor tax (employment) increase or decrease, respectively, in a given province in the 1990s. For Prince Edward Island, we treat the year of the second largest labor tax increase as event year as there was a simultaneous corporate tax reform in year of the largest labor tax increase.

¹⁸Two years are grouped together in bins to smooth the number of observations, as there are varying sample sizes in each year. The bins at the beginning (end) of the domain additionally include the years prior to (following) the domain’s starting (ending) year (Schmidheiny and Siegloch, 2023).

Figure 4: Effect of Labor Income Tax Rates on Contract Terms

Note: Figure presents coefficients and 95% confidence intervals of effect of labor tax rate on contract clause types. Each coefficient is from a separate OLS regression. Outcome: Clause type share (number of clauses of type in question over the number of all clauses). Treatment: Labor tax rate, defined as logarithmized implicit personal income tax rate. Controls: Province-by-sector fixed effects and year-by-sector fixed effects. Inference: Standard errors clustered at the province-by-sector level. Data sources: Employment and Social Development Canada, Center for the Study of Living Standards.

By lagging province level tax rates and income, our instrument does not identify from tax responses to province-level confounders and from endogenous income responses to taxes, respectively, but only from province tax changes due to changes in *federal* rates.

5.2 Effect of Labor Income Taxes on Worker Rights

This section reports how changes in personal income tax rates affects worker rights. We take the log of the tax rate to estimate elasticities of the associated clauses. The identification assumption is that tax rates affect the content of contracts without a third confounding variable influencing both, after adjusting for the fixed effects.

Figure 4 illustrates the OLS results from Equation 1. We report those results as coefficient plots with ranked effect sizes. We find that a higher income tax is associated with higher worker rights. This is consistent with a substitution away from the taxed income (wages) toward untaxed income (rights). In terms of magnitudes,

Table 5: Robustness: Labor Income Tax Rate and Worker-Rights Clauses

Drop Zero-Worker-Rights Clauses												X

Note: Coefficients and standard errors of effect of labor tax rate on worker rights clauses, for different specifications as indicated in table footer. Outcome: Share of worker rights clauses, defined as number of worker rights clauses over the number of all clauses. Treatment: Labor tax rate is defined as logarithmized implicit personal income tax rate. Controls: Pro-Union (Anti-Union) Law Controls includes set of separate indicator variables for whether a given law favorable (unfavorable) to unions is in place, see Table 3 in Legree et al. (2017) for list of laws. Inference: Standard errors clustered at the province-by-sector level, unless noted otherwise. Single, double, and triple asterisks indicate statistical significance at the 10%, 5%, and 1% levels, respectively. Data sources: Employment and Social Development Canada, Center for the Study of Living Standards.

these coefficients imply that a one percent increase in taxes is associated with an increase in the share of contractual worker rights between 0.03 to 0.09 percentage points. Table 5 show that the result for taxes and worker rights is robust to a range of parametric specifications controlling, among others, for province-specific time trends, firm fixed effects, or a set of variables encoding pro- and anti-union state laws (such as laws banning professional strike-breakers, or mandating secret-ballot certification elections).¹⁹

Beyond worker rights, we also observe a smaller tax effect on worker obligations. One interpretation of this effect is that some worker rights are granted conditionally, leading to an associated increase in worker obligations. The effect on worker rights holds when controlling for worker and firm obligations (Table 5 Column 10). Further, no other clause types are affected by the labor tax.

The main result for worker rights also holds in non-parametric event-study specifications. Figure 5 displays the dynamic Callaway and Sant’Anna (2021) estimator of large, discrete labor tax rate changes, where Panel A shows the effect for tax increases and Panel B shows the effect for tax decreases. For pre-event periods in both increases and decreases, we find no trend in worker rights, supporting the identifying assumption of parallel trends (p-value of omnibus hypothesis tests of zero pre-event

¹⁹The effects of labor tax and employment on worker rights also hold in subsamples of worker rights with and without numbers.

Figure 5: Event Study: Income Tax Increases/Decreases and Worker Rights

A. Discrete Increase in Labor Income Tax Rates

B. Discrete Decrease in Labor Income Tax Rates

Note: Figure presents coefficients and 95% confidence intervals for time indicators before and after labor tax rate increase (Panel A) or decrease (Panel B) on share of worker-rights clauses. Callaway and Sant’Anna (2021) estimator in the implementation of Rios-Avila et al. (2022), accounting for heterogeneous treatment effects and staggered treatment timing. Dynamic aggregation/event study effects, using doubly robust inverse probability weighting. Outcome: Share of worker rights (number of worker rights over the number of all clauses). Controls: Not-yet-treated observations. Numbers on horizontal axis refer to final year of respective two-year bins; i.e., -1 = last two years prior to event. Event is defined the largest labor tax increase or decrease, respectively in a given province in the 1990s, where labor tax rate is defined as logarithmized implicit personal income tax rate. Inference: Standard errors clustered at the province-by-sector level. For Panel A (tax increases), the p-values of omnibus hypothesis tests of zero individual pre- and post-event effects are 0.490 and 0.020, respectively. For Panel B (tax decreases), the associated p-values are 0.456 (pre-period) and 0.088 (post-period). Data sources: Employment and Social Development Canada, Center for the Study of Living Standards.

effects equals 0.49 for increases and 0.46 for decreases). After a tax increase (Panel A), we observe a significant increase in worker rights (p-value of omnibus hypothesis test of zero post-event effect equals 0.02). After a tax decrease (Panel B), we find a significant reduction in worker rights (p-value for joint significance of 0.09). In sum, the effects on worker rights go in opposite directions for tax increases and decreases, being consistent, respectively, with a substitution effect between taxed and untaxed income.

As additional robustness check, we present results from an instrumental variable approach in which we isolate exogenous changes in the *province* income tax that arise due to changes in *federal* tax rates. First, we analyse the first stage between our baseline tax variable and the instrument based on lagged province tax rates and income levels. As shown in Appendix Figure A.7, we find a strong first stage with a Kleibergen-Paap F-Statistic of 65. Second, we document that the 2SLS estimates of the instrumented tax rates on the different clause types paint a similar picture to the corresponding OLS estimates, in particular for worker rights, see Figure 6 (and Appendix Table for more robustness A.11). This implies that our main results are neither driven by endogenous income responses to taxes, nor by endogenous tax responses to province-level confounders.

5.3 Effects of Outside Options on Worker Rights

The second economic variable that we look at is the local sectoral employment rate at the time of contract negotiation. This leave-one-out employment rate can be seen as a positive shock to worker outside options, indicating a stronger labor market for workers. The identification assumption is that all omitted variables that are related to both the treatment (local employment) and outcome (clause type in the contract) are absorbed by province-sector and sector-year fixed effects.

The coefficients and standard errors across different clause types are reported in Figure 7. A higher employment rate is associated with an increase in measured worker rights, but not other clause types (except for a smaller effect on worker obligations, analogous to the tax analysis). Table 6 show that the estimate for worker rights is robust to a range of alternative specifications including province-specific time trends, firm fixed effects, or a set of variables encoding pro- and anti-union state laws.

The effect also holds in more flexible event-study specifications (Callaway and

Figure 6: Effect of Labor Income Tax Rates on Contract Terms, 2SLS and OLS estimations

Note: Figure presents OLS and 2SLS coefficients and 95% confidence intervals of effect of instrumented labour tax rate on contract clause types. Outcome: Clause type, defined as the share of clauses of given type (number of clauses of type in question over the number of all clauses). Treatment: Log Labour tax rate in province p and year t , for 2SLS instrumented as the log of the sum of federal income tax rate of year t , calculated for the average income of province p and year $t-k$, and the province income tax rate of province p and year $t-k$, calculated for the average income of province p and year $t-k$, for $k=1$. Each coefficient is from a separate regression. Controls: Province-by-sector fixed effects and year-by-sector fixed effects. Inference: Standard errors clustered at the province-by-sector level. Data sources: Employment and Social Development Canada, Center for the Study of Living Standards, Statistics Canada.

Figure 7: Effect of Outside Options (Employment Rate) on Contract Terms

Note: Figure presents coefficients and 95% confidence intervals of effect of leave-one-out employment rate on contract clause types. Each coefficient is from a separate OLS regression. Outcome: Clause type share (number of clauses of type in question over the number of all clauses). Treatment: leave-one-out employment rate in a given sector, defined as the logarithmized average over the employment rates in other sectors. Controls: Province-by-sector fixed effects and year-by-sector fixed effects. Inference: Standard errors clustered at the province-by-sector level. Data sources: Employment and Social Development Canada, Canadian Labor Force Survey.

Note: Coefficients and standard errors of effect of leave-one-out employment rate on worker rights clauses, for different specifications as indicated in table footer. Outcome: Share of worker rights clauses, defined as number of worker rights clauses over the number of all clauses. Treatment: leave-one-out employment rate in a given sector, defined as the logarithmized average over the employment rates in other sectors. Controls: Pro-Union (Anti-Union) Law Controls includes set of separate indicator variables for whether a given law favorable (unfavorable) to unions is in place, see Table 3 in Legree et al. (2017) for list of laws. Employment control controls for log employment rate (own sector). Inference: Standard errors clustered at the province-by-sector level, unless noted otherwise. Single, double, and triple asterisks indicate statistical significance at the 10%, 5%, and 1% levels, respectively. Data sources: Employment and Social Development Canada, Canadian Labor Force Survey.

Sant’Anna, 2021), as displayed in Figure 8. For employment rate increases (Panel A), there is no significant trend in worker rights for pre-event periods (p-value equals 0.26), and an increase in rights after the event, although shy of statistical significance (p-value equals 0.17). The corresponding event-study specification for employment *decreases* (Panel B) shows no pre-trends (p-value equals 0.94) and a decrease in rights after the event (p-value equals 0.001). In sum, worker rights move in opposite directions for employment increases and decreases, being consistent, respectively, with shifts in relative bargaining power between workers and employers.

5.4 Additional Results and Discussion

Interpreting the evidence. To summarize, we have two main empirical results. First, an increase in labor income taxes increases worker rights clauses. Second, an increase in the employment rate increases worker rights clauses. These effects are consistent with worker rights behaving like a non-wage amenity. Both of these effects are predicted by the model provided in Appendix B.

In the model, CBAs are characterized as incomplete contracts strategically negotiated between firms and unions. Firms offer combinations of wages and non-wage amenities (worker rights) under the threat of union strikes. Due to transaction costs involved in writing out contract terms, firms selectively include valuable amenities—such as vacation time or control rights—in the contract. These amenities serve as untaxed compensation, benefiting workers, while imposing costs on firms. Firms contract amenities up to the point where their marginal benefit equals marginal cost.

Consequently, the model makes two clear predictions. First, when labor income taxes increase, firms shift compensation towards untaxed amenities, resulting in more worker rights clauses. Second, enhanced bargaining power from improved worker outside options similarly incentivizes firms to increase contracted amenities. Those predictions align nicely with our empirical evidence.

Another prediction arising from the model is that when taxes go up, strikes should also become more frequent. We test this prediction by estimating Eq. (1) with strike intensity (worker days on strike during contract negotiation) as the outcome variable. Appendix Table A.13 shows that there is a positive and statistically significant effect of increased income taxes on strike intensity, and the result is robust across various fixed-effects specifications.

Figure 8: Event Study: Employment Increases/Decreases and Worker Rights
 A. Employment Rate Increases

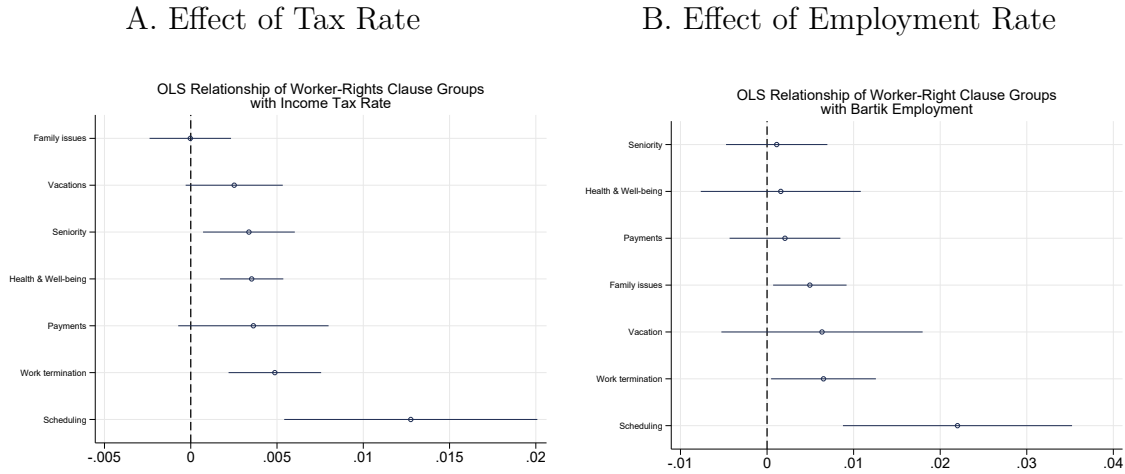

B. Employment Rate Decreases

Note: Figure presents coefficients and 95% confidence intervals for time indicators before and after employment increase (Panel A) or decrease (Panel B) on share of worker-rights clauses. Callaway and Sant'Anna (2021) estimator in the implementation of Rios-Avila et al. (2022), accounting for heterogeneous treatment effects and staggered treatment timing. Dynamic aggregation/event study effects, using doubly robust inverse probability weighting. Outcome: Share of worker rights (number of worker rights over the number of all clauses). Controls: Not-yet-treated observations. Numbers on horizontal axis refer to final year of respective two-year bins; i.e., -1 = last two years prior to event. Event is defined the largest employment increase or decrease, respectively in a given province in the 1990s, where employment is defined as leave-one-out employment rate in a given sector (average log employment in other sectors in the same province-year; there were no such observations for the 4-7 window for employment rate increases). Inference: Clustering at province-by-sector level. The p-values of omnibus hypothesis tests for employment increases (Panel A) for individual pre- and post-event effects are 0.257 and 0.169, respectively. For employment decreases (Panel B), those p-values are 0.935 and 0.001, respectively. Data sources: Employment and Social Development Canada, Canadian Labor Force Survey.

Figure 9: Effect of Tax Rate and Employment Rate on Worker-Rights Clauses, by Category

Note: These figures present coefficients and 95% confidence intervals of effect of labor tax rate (Panel A) and employment rate (Panel B) on worker-rights separately by different category, with the categories build using clustered sentence embeddings as described in Section 4.1. Each coefficient is from a separate OLS regression. Outcome: Share of worker rights clauses that belong to given topic group (number of worker rights clauses of topic group in question over the number of all clauses). Treatment (Panel A): Labor tax rate, defined as log implicit personal income tax rate. Treatment (Panel B): Leave-one-out employment rate in a given sector, defined as the average log employment over other sectors in the same province-year. Controls: Province-by-sector fixed effects and year-by-sector fixed effects. Inference: Standard errors clustered at the province-by-sector level. Data sources: Employment and Social Development Canada, Center for the Study of Living Standards, Canadian Labor Force Survey.

What types of rights do workers value most? To understand more precisely which worker rights are most valued, we analyze the effects of changes in labor income taxes and employment rates separately across specific categories of contract clauses. From the method described in Section 4.1, we have divided up the worker-rights clauses into seven broad categories of rights: Family Issues, Health & Well-Being, Payments, Scheduling, Seniority, Vacations, and Work Termination. We run the main regression specification for tax and employment effects, Eq. (1), with the outcome being the clause share of worker rights on that specific topic.

Figure 9 shows the estimates by worker-rights category, and we see notable heterogeneity across categories. For both taxes and employment, the largest effects are on rules related to Scheduling and Work Termination. There are more mixed results for the other topics. Tax increases also tend to boost Payments, Health & Well-being, Seniority, and Vacations. Employment increases tend to boost rights around Family

Issues.²⁰

It is notable that the most significant impacts of taxes and employment are those on scheduling and termination. That workers have a high value on control over their time, and also on the rules for how workers are terminated from employment. The value of these job elements to the life of these workers is self-evident, and the literature has produced related evidence for non-union workers (e.g. Mas and Pallais, 2017). Yet these amenities are control rights that cannot normally be priced by commonly used data sets. Control over time and termination are therefore omitted from traditional measures of priced benefits, such as health insurance or pensions. We have to analyze the text of contracts to understand their real value to workers.²¹

How valuable are worker rights? We think of the labor contract as a combination of wages and rights, with workers and firms trading them off based on relative costs and the relative value to workers (see Appendix B). To explore this tradeoff, and to better understand the monetary value of worker rights, we now look at the effect of taxes on wages, using the worker-level micro-data from the Canadian Labor Force Survey as the data source.

We model the log hourly wage w_{pjt} for worker j in province p at time t as a function of union status u_{pjt} , the log tax rate z_{pjt} , and their interaction. We regress

$$w_{pjt} = \rho_1 z_{pjt} + \rho_2 u_{pjt} + \rho_3 u_{pjt} z_{pjt} + \alpha_{ps} + \alpha_{st} + X'_{pjt} \beta + \epsilon_{pjt}, \quad (2)$$

where the other terms are as above, but now at the worker level. The coefficients of interest are ρ_1 , the effect of taxes on wages of non-union workers, ρ_2 , the average difference in wages between union and non-union workers, and ρ_3 , the interaction describing the relative effect of taxes on the wages of union workers.

Table 7 summarizes the main effects of the log tax rate on worker rights (in standard deviations) and log wages. In particular, Column 2 shows the estimates from Eq. (2). We see that (a) taxes are associated with increased pre-tax wages, consistent with partial pass-through to the firm; (b) union workers make more than

²⁰For effects on the more granular topics (30 categories), see Appendix Figures A.8 and A.12.

²¹Appendix Figures A.9 and A.13 show that the effects of taxes and employment are positive for both worker rights that are close and distant wage substitutes, respectively. Appendix Table A.12 reports some additional evidence suggesting that the effect of tax rates on wage-like amenities is more precisely estimated than the tax rate effect on rules / control rights – that is, the least wage-like clauses.

Sector-Year FEs	X	X
Dataset:	Union Contracts	Labour Force Survey

Note: Coefficients and standard errors of effect of labor tax rate worker rights clauses in the contracts (Column 1), and on log wages in the LFS (Column 2), where the latter also includes dummies for union and the interaction of log tax rate and union. Labor tax rate is defined as logarithmized implicit personal income tax rate. Inference: Standard errors clustered at the province-by-sector level. Single, double, and triple asterisks indicate statistical significance at the 10%, 5%, and 1% levels, respectively. Data sources: Employment and Social Development Canada, Center for the Study of Living Standards, Canadian Labor Force Survey.

non-union workers on average; and (c) a negative union interaction on $\text{union} \times \text{taxes}$, meaning the effect is statistically smaller for union workers, relative to non-union workers.²²

This negative interaction result is consistent with unionized firms doing more substitution between wages and amenities than non-unionized firms. Notably, the effect of taxes on pre-tax wages for non-union firms is wholly reversed for unionized firms, and actually goes negative. Unionized firms can bargain around untaxed amenities in addition to wages. In response to a tax increase, then, there is more movement among unions on rights clauses rather than wages. One explanation of these results is that contract writing is costly, and unions can produce a more complete contract by spreading contracting costs across the whole membership, rather than having separate contracting costs for each individual worker. In public finance, this result is important because it shows that estimates of taxable income elasticity may be biased if amenities are endogenous (e.g. Chetty, 2009; Chetty et al., 2011).

Our regression estimates for taxes mean that a 10% increase in the income tax rate would cause the share of worker rights in contracts to increase by about 0.23 standard deviations. Meanwhile, a 10% tax increase would cause union wages to fall by 1.3 percent. Taken together, these estimates imply that a one-S.D. increase in the share of worker rights is worth about 5.7 percent of wages (assuming no change in worker utility).

This estimate is not strictly comparable to estimates of workers' value of amenities from the literature, as the responsiveness of amenities to shocks in our data reflects firm costs of providing these amenities as well as bargaining parameters such as the costliness of strikes. Still, it is interesting that it is in line with other reported magnitudes. For example, Mas and Pallais (2017) estimate that the option for remote work is worth about 8 percent of wages to workers. The estimates in Lagos (2024) suggest that CBA employment protection is worth 4 percent of wages. Dube et al. (2022b) find that a one S.D. increase in "workplace dignity" is worth about 6 percent of wages, while Anelli and Koenig (2023) find that reducing workplace fatality risk by 1 in 100,000 is worth 9 percent of wages. Using data from job posts, Roussille and Scuderi (2023) find that a one S.D. increase in amenities is worth about 12 percent

²²See Appendix Figure A.10 for the coefficient plot. Appendix Figure A.11 shows that these results are robust to adding survey data from Gallup covering additional years to our main sample from the Canadian Labor Force Survey. Appendix Figure A.14 shows the effect of local employment rate on wages.

of wages. Our results situate the value of contracted worker rights among these other measures of workplace amenities.

Asymmetric responses due to wage rigidities. The event-study results show asymmetric responses in worker rights for both taxation and employment shocks. Tax increases could be offset by a combination of wage cuts and amenity increases, but in the presence of downward wage rigidity (e.g. Howitt, 2002), the main adjustment margin would be increased rights and amenities. Tax decreases could be met by a combination of wage increases and amenity decreases, and in the absence of upward wage rigidity could potentially result in just wage increases with no movement in amenities. Consistent with such rigidities, we find larger effects of tax increases than tax decreases.

We see corresponding asymmetries for the labor demand shock. Increases in outside options could be met with wage increases only, with no response of rights. But decreases in outside options (say when a contract expires in a recession), along with downward wage rigidity, would result in “concession bargaining” where the union gives up worker rights. Hence, we see a larger effect for a negative labor demand shock than a positive labor demand shock.

6 Conclusion

This paper applies natural language processing techniques to examine the content of labor union contracts. Our findings show that these contracts largely impose obligations on both workers and firms, while granting various rights to workers. The worker rights measure we introduce aligns with alternative metrics — including those from the World Management Survey — and corresponds with outputs of large language models. In our empirical analysis, worker rights differ across firms and shift over time in response to economic conditions.

The parser-based approach to analyzing union contracts opens up new insights on union preferences (Farber, 1986). By statistically comparing contracts negotiated by strong unions to those negotiated by weaker unions, researchers can systematically identify which types of clauses—rights, permissions, obligations, and prohibitions—unions prioritize in bargaining. These aspects of workplace autonomy are challenging to capture using traditional datasets, yet they likely contribute significantly to em-

ployee well-being. While prior studies have demonstrated how unions compress the income distribution, our analysis documents additional effects related to workplace rights. Insights derived from union contracts could thus inform policymakers aiming to craft effective labor-market regulations. Given recent attention to firm-level heterogeneity as a driver of wage inequality, understanding the specific institutional arrangements that regulate workplace conditions is essential to fully explaining disparities in earnings.

While there is a considerable literature measuring firm productivity, relatively little research has focused on quantifying workplace amenities, and even less on valuing worker autonomy (although see the recent review by Mas and Pallais (2020) on alternative work arrangements for non-union firms). Collective bargaining agreements offer a potential method for examining historical variations in workplace quality. Indeed, if unregulated labor markets are subject to imperfections, union-negotiated contracts — which prior research suggests may achieve efficient outcomes (Abowd 1989) — could provide more accurate valuations of job conditions than traditional hedonic wage regressions.

Future research could extend beyond worker rights clauses to analyze additional dimensions of union contracts. An intriguing observation, for instance, is the association between increased worker rights and heightened worker obligations. Drawing on Simon (1951), one interpretation is that when giving authority to an agent, one should also add limits to that authority. For example, while firms may provide workers autonomy over scheduling, such autonomy cannot be without limits. Our parser-based methodology allows for a clear separation of worker rights from obligations, and can similarly clarify other dimensions, such as firm obligations. An important open question is whether the observed combinations of clauses represent efficient bargains or instead impose unnecessary costs on firms. Additionally, our analysis has only briefly touched upon the large number of exemptions, contingencies, and other conditional or qualifying statements within contracts. Future approaches might reveal richer information regarding how real-world contracts incorporate state-contingent terms.

Finally, the findings in this paper are potentially important for contract theory. Recent work in contract theory provides good arguments for why simple (e.g. linear) contracts are robustly optimal (Carroll, 2019). But the real-world complexities of contracts, such as CBAs in Canada, remain beyond the grasp of current theoretical frameworks. As Jean Tirole emphasizes, “While there is no arguing that writing down

detailed contracts is very costly, we have no good paradigm in which to apprehend such costs” (Tirole, 1999, pp. 773). Oliver Hart, meanwhile, notes that “[a]ctual contracts are poorly worded, ambiguous, and leave out important things” (Hart, 2017, pp. 1732). Our granular, comprehensive empirical analysis of the details of CBAs is in line with the observation that real-world contracts are complex, and that this complexity should be explored by economists. While reliably converting the modal semantics of “possible worlds” in legal language into probabilistic statements about state-contingent payoffs is some distance in the future, tools like formal grammar parsing provide scaffolding on which a new generation of structural contract models can be built.

Note: List of most common subjects, modal verbs, and verbs in the extracted contract clauses, ordered by absolute frequency, respectively.

Table A.3: Contract Clause Typology

Categorization Logic	Examples
Obligations	
Positive & Strict Modal & Active Verb	shall provide, shall include, shall notify, shall continue
Positive & Strict Modal & Obligation Verb	shall be required, shall be expected, shall be obliged
Positive & Non-Modal & Obligation Verb	is required, is expected
Prohibitions	
Negative & Any Modal & Active Verb	shall not exceed, shall not use, shall not discriminate
Negative & Permission Verb	shall not be allowed, is not permitted
Positive & Strict Modal & Constraint Verb	shall be prohibited, shall be restricted
Permissions	
Positive & Non-Modal & Permission Verb	is allowed, is permitted, is authorized
Positive & Strict Modal & Permission Verb	shall be allowed, shall be permitted
Positive & Permissive Modal & Active Verb	may be, may request, may use, may require, may apply
Negative & Any Modal & Constraint Verb	shall not be restricted, shall not be prohibited
Rights	
Positive & Active & Active Rights Verb	shall receive, shall earn
Positive & Passive & Passive Rights Verb	shall be paid, shall be allowed
Negative & Any Modal & Obligation Verb	may not be required

Note: Typology of clause types, word patterns, and corresponding examples.

Table A.4: Example Subject-Verb Tuples by Clause Type

subject	obligations	prohibitions	permissions	right	others
worker	employee is required (41789) employee shall be (21968) employees shall be (14350)	employee shall not lose (3578) employee shall not be (3517) employee will not be (2997)	employee may request (11120) employee may elect (9148) employee shall be allowed (7524)	employee shall be paid (61643) employee shall receive (57367) employee has (54772)	employee is (181457) employee works (42449) employees are (24868)

Note: Most frequent examples of subject-verb tuples by clause type.

Figure A.3: Rights and Obligations Over Time, By Agent

Note: Mean number of rights and obligations for workers and firms, respectively, over time.

Table A.5: Summary Statistics: Number and share of zero clause types

Agent	Obligations		Rights		Permissions		Prohibitions	
	Count	%	Count	%	Count	%	Count	%
Worker	2,164	6.7	2,368	7.3	3,725	11.7	7,725	23.8
Firm	2,012	6.2	17,281	53.3	6,622	20.4	11,324	34.9
Union	4,069	12.6	13,684	42.2	11,481	35.4	22,257	68.7
Manager	13,080	40.4	27,968	86.3	24,821	76.6	29,656	91.5

Note: Counts and frequencies (%) of zero clause types in the contracts corpus, by agent (rows) and statement type (columns). Data source: Employment and Social Development Canada.

A.3 Appendix Material: Exploring and Validating Worker-Rights Clauses

Table A.7: Worker-Rights Clauses, By Industry Grouping

Industry Grouping	Worker-Rights Clauses	
	<i>Mean</i>	<i>Standard Deviation</i>
Construction	0.034	0.020
Educational, Health	0.041	0.025
Entertainment/Hospitality	0.038	0.024
Finance, real estate	0.048	0.025
Information and culture	0.041	0.026
Manufacturing	0.040	0.020
Primary industries	0.039	0.021
Public administration	0.048	0.032
Transportation	0.038	0.027
Utilities	0.046	0.021
Wholesale/Retail Trade	0.051	0.033

Note: Mean and Standard Error of worker rights clauses, by industry. Worker rights clauses defined as share of worker-rights clauses (number of worker rights clauses over the number of all clauses).

Table A.6: Example Worker-Rights Clauses

1. Employees should not be required to work more than two (2) hours after the end of their regular shift in such cases and shall be provided transportation by the Company, on request.
2. Such employees shall be paid not later than three (3) weeks after the date of application.
3. Where the Company schedules an employee to work in excess of seventy-seven (77) hours in one pay period, the employee will be paid for the excess hours at the applicable overtime rate.
4. However, an employee will receive one day of seniority if he or she works 5 or more hours on an overtime shift on Saturday or Sunday.
5. Standby Pay and Call-In Pay. An employee who is required by the Company to work overtime shall be paid at the rate of one and one-half times his applicable pro-rated hourly rate for time worked by him: (a) in excess of 8 hours in a work day
6. Where an employee is prevented by circumstances beyond his control from returning to work on time, he shall be paid for the holidays.
7. An employee who visits Occupational Health Services at the request of the Company following the completion of his shift will be paid in accordance with Section 16.01 and will be provided with transportation if necessary.
8. An employee in such instances will be paid at his/her regular rate upon returning to work.
9. If a general holiday falls on the regular pay day, employees shall be paid the last day worked before the general holiday.
10. Employees who retire as well as current retirees and survivors will be provided with Life Insurance in the amount of \$6,000.
11. The employee shall be entitled to additional time off for any holidays occurring within such vacation period.
12. An employee terminated during his probationary period would be entitled to review under the grievance procedure up to and including Step 3.
13. An employee not in a labour pool shall only be entitled to make application for an equal or higher rated job or, for a job which is in a line having a higher rated job than exists in his current line of promotion except that: 1 .
14. However, where practicable, senior employees in each job shall be given the opportunity to perform any available work in that job, on their shift, within their Department.
15. Any employee elected at the Federal or Provincial level will be granted a leave of absence without pay and without benefits, to extend to one (1) term in office.
16. The employee shall be entitled to additional time off for any holidays occurring within such vacation period.

Note: Sample of 16 worker rights from corpus (any typos come from OCR errors).

Table A.8: Share of Worker-Rights Clauses, By Union

Union	# of Contracts		Share of worker rights clauses
	Private-Sector	Public-Sector	
Canadian Union of Public Employees	234	1850	0.0411
National Automobile, Aerospace, Transportation and General Workers Union of Canada (CAW Canada)	836	189	0.0377
Public Service Alliance of Canada	317	664	0.0703
Ontario Nurses' Association	29	650	0.0433
International Brotherhood of Teamsters	624	47	0.0472
Service Employees International Union	128	510	0.0327
Ontario Secondary School Teachers' Federation	7	592	0.0369
Teamsters Canada	491	30	0.0459
Communications, Energy and Paperworkers Union of Canada	454	42	0.0434
Ontario English Catholic Teachers' Association	0	450	0.0445
Ontario Public Service Employees Union	37	324	0.0351
Elementary Teachers' Federation of Ontario	0	334	0.0472
United Steelworkers of America	303	18	0.0355
Alberta Teachers' Association	1	320	0.0532
United Food and Commercial Workers International Union	278	24	0.0452
Alberta Union of Provincial Employees	44	238	0.0589
Christian Labour Association of Canada	231	30	0.0583
United Steel, Paper and Forestry, Rubber, Manufacturing, Energy, Allied Industrial and Service Workers Intl. Union	210	24	0.0365
United Food and Commercial Workers Canada	219	10	0.0487
International Association of Machinists and Aerospace Workers	221	0	0.0353
International Brotherhood of Electrical Workers	115	80	0.0434
International Union of Operating Engineers	128	63	0.0476
Canadian Merchant Service Guild	167	3	0.0154
British Columbia Government and Service Employees' Union	70	82	0.0426
Seafarers' International Union of Canada	132	0	0.0308
Professional Institute of the Public Service of Canada	8	115	0.0816
Amalgamated Transit Union	71	45	0.0409
Unifor	92	23	0.0393
Laborers' International Union of North America	96	18	0.0373
United Brotherhood of Carpenters and Joiners of America	90	11	0.0373

Note: Share of worker rights clauses by union. Unions ordered by number of contracts in the private and public sector; top 30 unions displayed.

Table A.9: Match of Broad Topics and Narrow Topics

Broad Topic (Share)	Narrow Topic (Share)	Most Associated Words
Scheduling (0.228)	Work Hours (0.058)	hours, work, rate, shift, regular, minimum, worked, called, scheduled, half
	Seniority-Based Benefits (0.039)	service, year, years, plan, benefits, retirement, salary, date, month, 00
	Leave of Absence (0.039)	leave, absence, granted, union, elected, loss, period, seniority, employer, year
	Scheduling (0.030)	day, work, days, required, rest, scheduled, hours, consecutive, week, shift
	Overtime (0.026)	overtime, hours, work, worked, rate, regular, shift, required, half, scheduled
	Part-Time Employment (0.023)	hours, seniority, credit, basis, status, changed, service, worked, work, regular
	Breaks (0.013)	rest, minute, 15, break, shift, period, minutes, hours, periods, half
Vacation (0.146)	Vacations (0.045)	vacation, year, period, entitlement, annual, leave, employment, earned, following, service
	Seniority-Based Vacation (0.038)	vacation, years, service, year, weeks, continuous, completed, days, annual, percent
	Holiday Pay (0.037)	holiday, day, holidays, statutory, falls, vacation, general, following, work, regular
	Holiday Work Pay (0.026)	holiday, hours, rate, day, worked, holidays, regular, statutory, work, half
Health / Wellness (0.118)	Workplace safety (0.054)	union, agreement, required, provided, covered, granted, work, given, company, collective
	Sick Leave (0.025)	sick, leave, credits, days, illness, granted, absence, month, year, injury
	Workplace Injuries (0.024)	injury, compensation, injured, work, workers, disability, accident, medical, benefits, shift
	Meals (0.015)	meal, lunch, period, hours, hour, overtime, work, break, half, shift
Seniority (0.111)	Position Classification (0.036)	rate, classification, higher, job, position, salary, transferred, new, assigned, lower
	Job Security (0.030)	position, job, temporary, given, vacancy, hired, nurse, opportunity, offered, months
	Seniority & Promotion/Transfer (0.030)	seniority, given, senior, preference, selected, job, ability, qualifications, positions, classification
	Probation Period (0.015)	probationary, period, agreement, rights, probation, privileges, completion, hired, completed, seniority
Payments (0.098)	Payment Rules (0.051)	rate, weekly, regular, day, hourly, agreement, hours, work, bi, half
	Shift Premiums (0.025)	shift, hour, premium, cents, hours, worked, 00, rate, regular, hourly
	Reimbursements (0.022)	travel, transportation, expenses, reimbursed, allowance, traveling, vehicle, employer, use, business
Family Issues (0.086)	Grievance & Discipline (0.031)	grievance, steward, union, discipline, discharge, discharged, notified, representative, suspended, procedure
	Bereavement Leave (0.028)	death, law, bereavement, leave, funeral, days, granted, family, immediate, day
	Parental Leave (0.027)	leave, parental, child, maternity, weeks, pregnancy, granted, adoption, birth, pregnant
Termination (0.085)	Recall (0.032)	laid, layoff, recall, given, lay, hired, new, opportunity, work, recalled
	Notice Requirements (0.027)	notice, notified, given, days, layoff, change, advance, working, written, writing
	Termination (0.026)	severance, employment, service, notice, termination, laid, continuous, layoff, terminated, year
Others (0.128)	Teacher Compensation (0.066)	teacher, teachers, school, salary, occasional, teaching, board, year, experience, day,
	Teacher Leave (0.029)	teacher, leave, sick, school, year, granted, teachers, days, absence, board
	Files (0.024)	copy, file, given, written, provided, request, performance, review, personnel, appraisal
	Jury duty (0.009)	jury, witness, duty, court, subpoenaed, difference, required, day, received, serve

Note: Label, share (relative frequency), and 10 most associated words of topic clusters describing worker rights. Most associated words ordered by association strength. Data source: Employment and Social Development Canada.

Figure A.4: Worker-Rights Clauses Topics Over Time

Note: Shares of topic clusters of worker rights clauses, over time.

Figure A.5: Clause Types and Pro-Worker HR, Conditioning on Obligations

Note: Figure presents coefficients and 95% confidence intervals of regression of contract clause types on index for Pro-Worker HR Practices. Each coefficient is from a separate OLS regression. Outcome: Clause type share (number of clauses of type in question over the number of all clauses). Treatment: Standardized index of Pro-Worker HR Practices, defined as sum of approval rates to six statements about worker practices; it increases in “managers care about workers”, “promotes good workers”, and “employees are valued,” and decreases in “focus on top talent”, “incentives”, and “fire poor performers”. Controls: Firm obligations and worker obligations, defined as share of clauses of given type (number of clauses of type in question over the number of all clauses). Inference: Heteroscedasticity-robust standard errors. Data sources: Employment and Social Development Canada, World Management Survey (Bloom et al., 2012).

Figure A.6: Worker-Rights Clauses, Pro-Worker HR Practices, and Excess Employment Amenity Measure

A. Pro-Worker HR Practices vs. Worker-Rights Clauses

B. Excess Employment Amenity Measure vs. Worker-Rights Clauses

C. Excess Employment Amenity Measure vs. Pro-Worker HR Practices

Note: Panel A: Binscatter plot of worker rights clauses (horizontal axis) and index for Pro-Worker HR Practices (vertical axis). Panel B: Binscatter plot of worker rights clauses (horizontal axis) and excess employment amenity index (vertical axis, defined in Section 4.4). Panel C: Binscatter plot of excess employment amenity index (horizontal axis) and index for Pro-Worker HR Practices (vertical axis). Worker rights clauses is defined as share of worker rights clauses (number of worker rights clauses over the number of all clauses). Index of Pro-Worker HR Practices is defined as standardized sum of approval rates to six statements about worker practices; it increases in “managers care about workers”, “promotes good workers”, and “employees are valued,” and decreases in “focus on top talent”, “incentives”, and “fire poor performers”. “Excess employment amenity measure” is the text-predicted firm size, controlling for wages. Worker right measure significantly positively correlated with Pro-Worker HR Practices (Panel A). Excess employment is significantly positively correlated with worker rights measure (Panel B), but not correlated with the pro-worker HR practices (Panel C). Data sources: Employment and Social Development Canada, World Management Survey (Bloom et al., 2012).

A.4 Appendix Material: Supporting Results

Table A.10: Effect of Tax Rate and Employment Rate on Selected Outcomes

	Firm Entry	Firm Exit	Firm Size	COLA Clause
	(1)	(2)	(3)	(4)
Panel A:				
Log Income Tax Rate	0.253 (0.191)	-0.151 (0.165)	-0.391 (0.478)	0.003 (0.182)
R-Squared	0.17	0.09	0.32	0.16
Number of Observations	22,864	22,864	24,826	24,826
Panel B:				
Log Employment Rate	0.261 (0.323)	-0.010 (0.341)	-1.040 (0.968)	-0.268 (0.383)
R-Squared	0.17	0.24	0.32	0.15
Number of Observations	26,725	26,725	29,157	29,157
Province-Sector FEs	X	X	X	X
Sector-Year FEs	X	X	X	X

Note: Coefficients and standard errors of effect of log tax rate (Panel A) and leave-one-out average log employment rate (Panel B) on outcome indicated in the column header (firm entry, firm exit, and COLA clause are indicator variables, firm size is in logs). Sample of firm entries and firm exists excludes firms that only appear once in the dataset. Inference: Standard errors clustered at the province-by-sector level. Single, double, and triple asterisks indicate statistical significance at the 10%, 5%, and 1% levels, respectively. Data sources: Employment and Social Development Canada, Center for the Study of Living Standards, Canadian Labor Force Survey.

Figure A.7: Income Tax IV: First Stage

Note: Figure presents first stage binscatter of labour income tax rate (vertical axis) and predicted income tax rate based on lagged rates and exemptions (horizontal axis). Kleibergen-Paap First Stage F-Statistic = 65.08. Controls: Province-by-sector fixed effects and year-by-sector fixed effects. Data sources: ESDC, Center for the Study of Living Standards, Statistics Canada.

Table A.12: Worker Rights, Labor Tax, and HR Index

	Worker Rights (Distant Wage Substitutes) (1)	Worker Rights (Close Wage Substitutes) (2)	Worker Rights (Distant Wage Substitutes) (3)	Log Income Tax Rate (4)	Pro-Worker HR Index (5)
Log Income Tax Rate	1.354* (0.793)	1.162*** (0.313)	1.280 (0.812)		
Worker Rights (Close Wage Substitutes)			0.063 (0.060)	0.0005*** (0.0002)	0.144 (0.209)
Worker Rights (Distant Wage Substitutes)				0.0006 (0.0004)	1.487*** (0.402)
R-Squared	0.24	0.19	0.24	0.91	0.13
Number of Observations	23,553	23,553	23,553	23,553	113
Province-Sector FEs	X	X	X	X	
Sector-Year FEs	X	X	X	X	

Note: Outcome variables indicated in column header. Worker rights variables standardized. Substitutability with wages of given topic calculated as the dot-product similarity between the centroid of the topic and the following 20 statements: "Employees shall have ..." incentive-based pay. a commission. a production bonus. a piece rate. a cost-of-living allowance. hazard pay. a uniform allowance. a tool allowance. free room and board. subsidized room and board. paid vacation leave. paid holiday leave. paid sick leave. paid personal leave. overtime pay. shift differential pay. life insurance. health insurance. disability insurance. retirement benefits. 16 topics most (least) close to these statements are grouped in categories of close (distant) substitutes of wages. Share of worker entitlements (number of worker rights clauses over number of all clauses). Standard errors clustered at the province-by-sector level, except for column 5. Single, double, and triple asterisks indicate statistical significance at the 10%, 5%, and 1% levels, respectively.

Figure A.8: Effect of Labor Income Tax Rates Worker-Rights Clauses by Topic – 30 Topics

Note: Figure presents coefficients and 95% confidence intervals of effect of labor tax rate on worker right topics. Each coefficient is from a separate OLS regression. Outcome: Share of worker rights clauses that belong to given topic (number of worker rights clauses of topic in question over the number of all clauses). Treatment: Labor tax rate, defined as log of implicit personal income tax rate. Controls: Province-by-sector fixed effects and year-by-sector fixed effects. Inference: Standard errors clustered at the province-by-sector level. Data sources: Employment and Social Development Canada, Center for the Study of Living Standards.

Figure A.9: Effect of Tax Rates on Worker-Rights Clauses, by Substitutability with Wages

Note: Figure presents coefficients and 95% confidence intervals of effect of log labor tax rate on worker-right topical categories (by substitutability with wages). Substitutability with wages of given topic calculated as the dot-product similarity between the centroid of the topic and the following 20 statements: "Employees shall have ..." incentive-based pay. a commission. a production bonus. a piece rate. a cost-of-living allowance. hazard pay. a uniform allowance. a tool allowance. free room and board. subsidized room and board. paid vacation leave. paid holiday leave. paid sick leave. paid personal leave. overtime pay. shift differential pay. life insurance. health insurance. disability insurance. retirement benefits. 16 topics most (least) close to these statements are grouped in categories of close (distant) substitutes of wages. Each coefficient is from a separate OLS regression. Outcome: Worker right topic, defined as standardized mean of 16 applicable topics, each defined as share of worker rights clauses that belong to given topic (number of clauses of topic in question over the number of all clauses). Treatment: Labor tax rate, defined as log of implicit personal income tax rate. Controls: Province-by-sector fixed effects and year-by-sector fixed effects. Inference: Standard errors clustered at the province-by-sector level. Data sources: Employment and Social Development Canada, Center for the Study of Living Standards.

Table A.11: Effect of Instrumented Labor Tax on Worker Rights

Outcome:	Lag = 1 years			Lag = 3 years		
	First Stage Log Tax Rate	Reduced Form Worker Rights	2SLS Worker Rights	First Stage Log Tax Rate	Reduced Form Worker Rights	2SLS Worker Rights
	(1)	(2)	(3)	(4)	(5)	(6)
Instrumented Log Tax Rate	0.335*** (0.042)	0.023** (0.010)	0.068*** (0.025)	0.212*** (0.038)	0.020* (0.011)	0.092** (0.041)
Kleibergen-Paap rk Wald F-Statistic			65.08			31.67
R-Squared	0.92	0.15	0.003	0.92	0.15	0.002
Number of Observations	24,826	24,826	24,826	24,826	24,826	24,826
Province-Sector FEs	X	X	X	X	X	X
Sector-Year FEs	X	X	X	X	X	X

Note: Figure presents the first stage, reduced form, and 2SLS coefficients of estimation of instrumented labor tax rate on worker rights. Outcome: Clause type, defined as the share of clauses of given type (number of clauses of type in question over the number of all clauses). Treatment: Log Labor tax rate in province p and year t, instrumented as the log of the sum of federal income tax rate of year t, calculated for the average income of province p and year t-k, and the province income tax rate of province p and year t-k, calculated for the average income of province p and year t-k, for k=1, and k=3. Controls: Province-by-sector fixed effects and year-by-sector fixed effects. Inference: Standard errors clustered at the province-by-sector level. Single, double, and triple asterisks indicate statistical significance at the 10%, 5%, and 1% levels, respectively. Data sources: Employment and Social Development Canada, Center for the Study of Living Standards, Statistics Canada.

Figure A.10: Effect of Labor Income Tax Rates and Union Status on Wages

Note: Figure presents coefficients and 95% confidence intervals of effect of labor tax rate, union status, and the interaction of labor tax rate and union status on individual wages. All coefficient are from the same OLS regression. Outcome: Individual wages, defined as worker's logarithmized hourly wage (before taxes and other deductions, but including tips, commission and bonuses). Treatments: Labor tax rate, defined as logarithmized implicit personal income tax rate; union status, defined as indicator variable that equals one if worker is member of a union, and zero otherwise. Controls: Province-by-sector fixed effects, and year-by-sector fixed effects. Inference: Standard errors clustered at the province level. Sample: 1999-2006 (excludes years from the financial crisis 2007 onward). Data sources: Canadian Labor Force Survey, Center for the Study of Living Standards.

Figure A.11: Effect of Labor Income Tax Rates and Union Status on Wages, adding Gallup data

Note: Figure presents coefficients and 95% confidence intervals of effect of labor tax rate, union status, and the interaction of labor tax rate and union status on individual wages. All coefficients are from the same OLS regression. Sample: Merge of Gallup (1986-1996) and Canadian Labour Force Survey (1997-2006). Outcome: Individual wages, defined as worker's logarithmized hourly wage (before taxes and other deductions, but including tips, commission and bonuses). For Gallup, outcome is calculated from harmonized annual income levels (assuming 52 weeks per year and 36 working hours per week). Treatments: Labor tax rate, defined as logarithmized implicit personal income tax rate; union status, defined as indicator variable that equals one if worker is member of a union, and zero otherwise. Controls: Province fixed effects, and year fixed effects. Note that we do not have sector information for Gallup and therefore cannot interact province and year fixed effects with sector (not interacting these fixed effects allows to add data from the Canadian Labor Force Survey for 1997 and 1998 for which we also do not have sector information). Inference: Standard errors clustered at the province level. Data sources: Canadian Labor Force Survey, Gallup, Center for the Study of Living Standards.

Figure A.12: Effect of Employment Rate on Worker-Rights Clauses by Topic

Note: Figure presents coefficients and 95% confidence intervals of effect of 1 leave-one-out average log employment rate on worker right topics. Each coefficient is from a separate OLS regression. Outcome: Worker right topic, defined as share of worker rights clauses that belong to given topic (number of clauses of topic in question over the number of all clauses). Treatment: Leave-one-out employment rate in a given sector, defined as the average log employment rates in other sectors in the same province and year. Controls: Province-by-sector fixed effects and year-by-sector fixed effects. Inference: Standard errors clustered at the province-by-sector level. Data sources: Employment and Social Development Canada, Canadian Labor Force Survey.

Figure A.13: Effect of Employment on Worker-Rights Clauses, by Substitutability with Wages

Note: Figure presents coefficients and 95% confidence intervals of effect of leave-one-out log average employment rate on worker-right topical categories (by substitutability with wages). Substitutability with wages of given topic calculated as the dot-product similarity between the centroid of the topic and the following 20 statements: "Employees shall have ..." incentive-based pay. a commission. a production bonus. a piece rate. a cost-of-living allowance. hazard pay. a uniform allowance. a tool allowance. free room and board. subsidized room and board. paid vacation leave. paid holiday leave. paid sick leave. paid personal leave. overtime pay. shift differential pay. life insurance. health insurance. disability insurance. retirement benefits. 16 topics most (least) close to these statements are grouped in categories of close (distant) substitutes of wages. Each coefficient is from a separate OLS regression. Outcome: Worker right topic, defined as standardized mean of 16 applicable topics, each defined as share of worker rights clauses that belong to given topic (number of clauses of topic in question over the number of all clauses). Treatment: Leave-one-out employment rate in a given sector, defined as the average log of employment rates in other sectors in the same province and year. Controls: Province-by-sector fixed effects and year-by-sector fixed effects. Inference: Standard errors clustered at the province-by-sector level. Data sources: Employment and Social Development Canada, Center for the Study of Living Standards.

Figure A.14: Effect of Employment Rates and Union Status on Wages

Note: Figure presents coefficients and 95% confidence intervals of effect of employment rate, union status on the interaction of employment rate and union status on individual wages. All coefficient are from the same OLS regression. Outcome: Individual wages, defined as worker's log hourly wage (before taxes and other deductions, but including tips, commission and bonuses). Treatments: Leave-one-out employment rate in a given sector, defined as the average of log employment rates in other sectors in the same province-year; union status, defined as indicator variable that equals one if worker is member of a union, and zero otherwise. Controls: Province-by-sector fixed effects and year-by-sector fixed effects. Sample: 1999-2006 (excludes years from the financial crisis 2007 onward). Inference: Standard errors clustered at the province level. Data source: Canadian Labor Force Survey.

Note: Coefficients and standard errors of effect of labor tax rate (Panel A) or leave-one-out employment rate (Panel B) on strike intensity, for different specifications as indicated in table footer. Outcome: Strike intensity, defined as square root of number of working days lost to a strike during this contract negotiation. Treatment, Panel A: Labor tax rate is defined as log of implicit personal income tax rate. Treatment, Panel B: Leave-one-out employment rate in a given sector, defined as the average of log employment rates in other sectors in the same province and year. Inference: Standard errors clustered at the province-by-sector level. Single, double, and triple asterisks indicate statistical significance at the 10%, 5%, and 1% levels, respectively. Data sources: Employment and Social Development Canada, Center for the Study of Living Standards, Canadian Labor Force Survey.

B Model Appendix: Collective Bargaining Agreements as Endogenously Incomplete Contracts

This section considers a simple union-firm bargaining model. A contract consists of a wage and a collection of rights to certain amenities. The right to exercise an amenity may conflict with the control over time (e.g. vacations, paid time off, scheduling rules). Management will thus be reluctant to provide high levels of these amenities during the production process. Thus, in order for a worker to have the right to a particular amenity it must be contracted upon *ex ante*. Under the hypothesis that there are some costs associated with adding contract terms, as in Townsend (1979) and Dye (1985), it is optimal to allocate more valuable amenities to the contract until the costs outweigh the benefits. That is similar to the framework in Mulligan and Shleifer (2005) in the context of regulatory text.

Bargaining is costly, while the number of potential clauses is unlimited. Hence, we can view a contract as a *capital good* with stock K_t in bargaining period t . For simplicity the contract is characterized by the number of clauses of type $t \in T$, where T is given by the clauses in Table .

In principle, there could be an unlimited number of amenities or worker rights, indexed by $i \geq 0$. It is assumed that workers can bargain for amenities $a^w(i) > a^f(i)$ above what the firm would offer. Amenities are normalized such that $a(i) = a^w(i) - a^f(i)$ is the increase in amenities above what the firm would choose in the absence of a contract. This value can come from two sources. First, there are non-production amenities such as paternity leave and vacation time. Second, there are production-related control rights – including the right to refuse some types of work, or the right to organize the pace and manner with which the work is done.

Both non-production amenities and control rights have the feature that the worker does not have to exercise the right. For example, workers that do not have children will not exercise the right for parental leave. Let $\lambda(i)$ be the fraction of workers who will exercise right or amenity i . The value of a contract right depends upon the intrinsic value of the right and the number of individuals who exercise the right. Let $\beta(i) = \lambda(i) a(i)$ be the value of amenity or right i to the union. Without loss of generality, amenities are indexed so that $\beta'(i) < 0$. It is also assumed that $\beta''(i) > 0$ and $\lim_{i \rightarrow \infty} \beta(i) = 0$. The cost of rights are normalized to have the same marginal cost c . Amenities are assumed to be workplace public goods, and so their costs do

not increase with firm size, as in Mulligan and Shleifer (2005).

Each amenity $a(i)$ is implemented via a fixed contract clause. It is assumed that clauses are nominally expensive and hence given T clauses, it is efficient to maximize the value of amenities delivered with T clauses. The total value of amenities with a contract of length T is:

$$A(T) = \int_0^T \beta(i) di, \quad (3)$$

and hence $A'(T) = \beta(T)$ and $A''(T) = \beta'(T) < 0$.

Workers have constant marginal product p and are paid a uniform wage w , taxed at a rate τ . Workers like rights to actions (including amenities) while employers dislike them with cost $cA(T)$. Union collective bargaining agreements are contracts over wages and ex-ante actions that workers are allowed to take, or amenities that firms must provide. The preferences of the union per worker over wages and amenities is given by a constant elasticity of substitution function:

$$V(T, w) = \left(A(T)^\rho + ((1 - \tau)w)^\rho \right)^{1/\rho}, \quad (4)$$

where $\tau \in (0, 1)$ is the personal income tax rate. For this standard CES functional form the elasticity of substitution between amenities and net wages $(1 - \tau)w$ is $\sigma = \frac{\rho}{1 - \rho}$, where $\rho \in [0, 1]$.

The firm will make an offer to workers of a contract with T amenities, with value $A(T)$ and wage w , denoted by $K = \{T, w\}$. This offer faces a noisy outside option given by the union's strike threat. More precisely, if $V(K) < V^0 + \epsilon$ then workers will go on strike. If the support of ϵ is positive, this ensures that workers get at least V^0 .

The timing is:

1. Firms choose the wage w and the number of amenities/rights T , producing a total value of amenities/rights $A(T)$.
2. If $V(K) < V^0 + \epsilon$, the firm strikes and workers get V^0 , the outside option. If not, then the union accepts the contract that is then implemented. Production begins.
3. If the action is contracted ($i \leq T$) then a fraction $\lambda(i)$ of workers choose to exercise the right or amenity $a(i)$. If the action is not contracted, the manager

chooses the action $a^f(i)$.

4. Production is completed. Utility is realized and wages are paid to workers that are still employed.

Moving to the production function. Let $G(V(K) - V^0) = \Pr[V(K) - V^0(\tau) > \epsilon]$ be the probability that workers do *not* go on strike. It is assumed that when a strike occurs, profits are zero. Assuming constant returns to scale, the profit function of the firm offering contract $K = \{T, w\}$ is

$$\Pi(K) = (pN - wN - c \times A(T)) G(V(K) - V^0), \quad (5)$$

where N is the size or demand for the firm's product (which is not modeled), p is the product price, w the wage rate, and $c \times A(T)$ is the cost of providing amenities using T contract terms. The firm offers the union/workers efficient contract terms K that minimize costs for a given level of union utility.

To get convenient closed-form solutions, let $G' = g$ on its support $[0, 1/g]$. In that case we have $G(x) = gx$, for $0 \leq x < 1/g$ and $G(x) = 1$ for $x \geq 1/g$. This implies that if $V \geq V^0 + 1/g$ then there will be no strike. Thus, the probability of no strike is:

$$\Pr[V(K) - V^0 > \epsilon] = G(V(K) - V^0) = \min\left\{1, \max\left\{0, g(V(K) - V^0)\right\}\right\} \in [0, 1]. \quad (6)$$

Note that this expression shows that the probability of a strike may depend on the value of the contract and of the outside option. We use this to motivate an empirical comparison of strike intensity with taxes. Table A.13 shows evidence that an increase in the local tax rate increases strike intensity, as measured by number of worker days on strike. Hence, $g(V(K) - V^0)$ is decreasing. This can occur either due to more uncertainty (g is smaller) or fewer rents ($V(K)$ is smaller), or both. That supports our interpretation of the shocks.

Now we present our main proposition.

Proposition 1. *Suppose g is sufficiently small, so that there is a positive probability of a strike. At an efficient contract K , the wage as a function of contract terms is:*

$$w^*(1 - \tau) = A(T) \left(\frac{\hat{c}}{N}\right)^{1/(1-\rho)}, \quad (7)$$

where $\hat{c} = c(1 - \tau)$. Hence, an increase in the tax rate τ lowers the wage relative to amenities. Given the number of pro-worker clauses T^* , union utility is

$$V(T^*) = A(T^*) v\left(\frac{\hat{c}}{N}\right), \quad (8)$$

where

$$v\left(\frac{\hat{c}}{N}\right) = \left(1 + \left(\frac{\hat{c}}{N}\right)^{\rho/(1-\rho)}\right)^{1/\rho}.$$

If both wages and amenities are positive in equilibrium, then the equilibrium level of amenities is given by:

$$A(T^*) = \frac{1}{2} \left\{ \frac{pN}{c \left(\left(\frac{\hat{c}}{N} \right)^{\rho/(1-\rho)} + 1 \right)} + \frac{V^0}{v(\hat{c}/N)} \right\} \quad (9)$$

$$= \frac{1}{2} \left\{ \frac{pN}{cv(\hat{c}/N)^\rho} + \frac{V^0}{v(\hat{c}/N)} \right\}. \quad (10)$$

The proof is provided in Appendix B.2.

From (10), we get the following corollary:

Corollary 2. *The number of amenities/rights T^* increases with an increase in the income tax τ , firm size N , firm productivity p , and the worker's outside option V^0 .*

This result is consistent with our empirical findings. The model shows that the results follow from an efficiency-minded firm offering a contract to a union subject to a strike threat. One would obtain similar results from an efficient bargaining model, though the magnitudes of the effects will vary with the details.

B.1 Explaining Contract Categories

The previous analysis makes the basic point that if the contract provides unpriced amenities to workers then an increase in the income tax leads to an increase in contracted upon worker rights. This section discusses the forces that lead to the addition of other clauses in the collective agreement. To simplify matters, clauses are divided into three groups, worker rights, denoted by T^W , firm rights, denoted by T^F , and all other clause, T^O .

The model in the previous section is technically equivalent to supposing that a worker must get an outside option u^0 , that implicitly incorporates any cost of strikes. Thus, we may suppose that a worker's utility is given by:

$$U = V(T^W, (1 - \tau)w) = u^0. \quad (11)$$

From this, we can solve for the wage as $w(T^W, \tau, u^0)$. It is then assumed that the benefit of contracting to the firm is given by a twice differentiable, concave fixed benefit $\pi(\vec{T})$, where the number of worker rights, firm rights and other clauses is given by $\vec{T} = \{T^W, T^F, T^O\} \geq \vec{0}$. It is assumed to satisfy:

$$\pi(\vec{0}) = 0, \quad (12)$$

$$\partial\pi/\partial T^i < 0, i = W, F, \quad (13)$$

$$\partial\pi/\partial T^O(0, 0, T^{*O}) = 0, \quad (14)$$

where $T^{*O} > 0$ is the optimal number of other clauses given that there is a union. The clauses given by T^O provide definitions and basic parameters for the collective agreement. Finally, we assume that clauses are complements:

$$\frac{\partial^2\pi}{\partial T^i\partial T^j}, i \neq j, i, j \in \{W, F, O\}. \quad (15)$$

This assumption can be viewed as a formal implementation of the Simon (1951) model. In that model he assumes that when the worker agrees to employment she give the right to the firm to direct her work. However, such a right cannot be unlimited. For example, the firm might ask the worker for extra hours of work. Thus, any right given to the firm is counter balanced by constraints. Conversely, if the firm gives the worker a right, it might be constrained. For example, the worker may have the right to seek medical attention during the hours of employment. However, to ensure that the visits are necessary, the firm might add the clause that the worker must provide a letter from the doctor. This is an example of where a work right (the right to seek medical treatment) is paired with the firm's right to verify the need for the appointment. This is effect is captured by condition (15).

Combining the benefits from contracting with the firms costs and revenues, firm

profits are given by:

$$\Pi(\vec{T}, \tau, u^0) = py(N) + \pi(\vec{T}) - N \times \cdot w(T^W, \tau, u^0), \quad (16)$$

where N is the number of workers at the firm. From which we have:

Proposition 3. *At an optimal contract characterized by:*

$$\vec{T}(\tau, u^0) = \arg \max_{\vec{T} \geq \vec{0}} \Pi(\vec{T}, \tau, u^0)$$

satisfies $\partial T^i / \partial \tau, \partial T^i / \partial u^0 \geq 0, i = W, F, O$.

Proof. From (11) and (16) it follows that $\partial^2 \Pi / \partial \tau \partial T^W, \partial^2 \Pi / \partial u^0 \partial T^W \geq 0$, and with strict inequality when $T^W > 0$. The assumptions made on $\pi(\cdot)$ ensure that $\partial^2 \Pi / \partial T^i \partial T^j \geq 0$ for $i \neq j, i, j = W, F, O$. Finally, $\partial^2 \Pi / \partial \tau \partial T^i = 0, i = F, O$. Hence the profit function satisfies the conditions of theorem 6 of Milgrom and Shannon (1994) that ensures the profit function is supermodular in contract clauses and has increasing differences in τ and u^0 . Thus, the proposition follows immediately from theorem 5 of Milgrom and Shannon. \square

This proposition illustrates that the effect of both taxes and the outside option on the number of clauses in a contract is very general. It also implies that as the firm gets larger (N increases) the number of clauses in a contract increases. The relative importance of these effects can be captured by running the regressions in shares. This model predicts that the numbers of clauses T^O and T^F cannot increase without an increase in the number of worker rights. The extent to which these clause varies is an empirical question. When regressions are run in turns of shares, then this provides information on how the relative number of clauses varies with changes in the income tax and outside option.

B.2 Proof of Proposition (1)

Proof. It is assumed that a strike occurs with positive probability, hence $V(K|\tau) < V^0 + 1/g$. The first order condition for wages is given by:

$$\frac{\partial \Pi}{\partial w} = -gN\Delta V + MR \times g \frac{\partial V}{\partial w} = 0,$$

where $\Delta V = V(K|\tau) - V^0 > 0$. This inequality follows from the fact that product price is sufficiently high that profitable production is possible. The marginal revenue from production is given by $MR = (p \times N - w \times N - c \times A(T))$.

This implies:

$$\frac{\partial V}{\partial w} = \frac{N \times \Delta V}{MR}.$$

We get a similar formula for the level of amenities, T :

$$\frac{\partial \Pi}{\partial T} = -c \times A'(T) \times g \times \Delta V + MR \times g \frac{\partial V}{\partial T} = 0,$$

and thus:

$$\frac{\partial V}{\partial T} \frac{1}{cA'(T)} = \frac{\Delta V}{MR}.$$

From this we get:

$$\frac{cA'(T) \times \partial V / \partial w}{\partial V / \partial T} = N. \quad (17)$$

Next we compute the effects on union utility:

$$\begin{aligned} \frac{\partial V}{\partial w} &= V^{(1-\rho)} \times \{(1-\tau)w\}^{\rho-1} (1-\tau), \\ \frac{\partial V}{\partial T} &= V^{(1-\rho)} \times \{A(T)\}^{\rho-1} A'(T). \end{aligned}$$

We can plug these back into (17). Notice that the $A'(T)$ drops out and we get (using the fact that $\rho < 1$):

$$\frac{cA'(T) \times V^{(1-\rho)} \times w^{\rho-1} (1-\tau)^\rho}{V^{(1-\rho)} \times \{A(T)\}^{\rho-1} A'(T)} = N,$$

or

$$\frac{w}{A(T)} = \frac{c^{1/(1-\rho)} (1-\tau)^{\rho/(1-\rho)}}{N^{1/(1-\rho)}}, \quad (18)$$

$$w(1-\tau) = A(T) \left(\frac{\hat{c}}{N} \right)^{1/(1-\rho)}, \quad (19)$$

where $\hat{c} = c(1-\tau)$, which gives us (7).

Putting this into union preferences gives us:

$$\begin{aligned}
V^*(T) &= \left(A(T)^\rho + \left\{ A(T) \left(\frac{\hat{c}}{N} \right)^{1/(1-\rho)} \right\}^\rho \right)^{1/\rho}, \\
&= A(T) \left(1 + \left(\frac{\hat{c}}{N} \right)^{\rho/(1-\rho)} \right)^{1/\rho}, \\
&= A(T) v(\hat{c}),
\end{aligned}$$

where

$$v(\hat{c}) = \left(1 + \left(\frac{N}{\hat{c}} \right)^{\rho/(1-\rho)} \right)^{1/\rho}.$$

To compute the optimal contract length we substitute (7) and (8) into the profit function:

$$\Pi(T) = \left(pN - \left(\left(\frac{\hat{c}}{N} \right)^{1/(1-\rho)} \times \frac{N}{(1-\tau)} + c \right) \times A(T) \right) \times G(V(T) - V^0).$$

Given that a monotonic transformation does not change the optimization problem, we can divide by g (we have assumed that strikes occur with positive probability) to get:

$$\hat{\Pi}(T) = \left(pN - \left(\left(\frac{\hat{c}}{N} \right)^{1/(1-\rho)} \times \frac{N}{(1-\tau)} + c \right) \times A(T) \right) \times (V(T) - V^0).$$

The first order condition is:

$$\begin{aligned}
0 = \frac{d\Pi}{dT} &= - \left(\left(\frac{\hat{c}}{N} \right)^{1/(1-\rho)} \times \frac{N}{(1-\tau)} + c \right) \times A'(T) (V(T) - V^0) + \\
&\quad \left(pN - \left(\left(\frac{\hat{c}}{N} \right)^{1/(1-\rho)} \times \frac{N}{(1-\tau)} + c \right) \times A(T) \right) A'(T) v(\hat{c}).
\end{aligned}$$

The A' terms drop out. Let:

$$\begin{aligned} h(\tau, N) &= \left(\left(\frac{\hat{c}}{N} \right)^{1/(1-\rho)} \times \frac{N}{(1-\tau)} + c \right) \\ &= c \left(\left(\frac{\hat{c}}{N} \right)^{\rho/(1-\rho)} + 1 \right). \end{aligned}$$

Then we get

$$\begin{aligned} h(\tau, N) \left(A(T) v(\hat{c}) - V^0 \right) &= (pN - h(\tau, N) A(T)) v(\hat{c}) \\ 2h(\tau, N) A(T) &= pN + V^0 h(\tau, N) / v(\hat{c}). \end{aligned}$$

Thus we have:

$$A(T^*) = \frac{1}{2} \left\{ \frac{pN}{h(\tau, N)} + \frac{V^0}{v(\hat{c})} \right\}$$

and we get the following expression for optimal contract length:

$$\begin{aligned} A(T^*) &= \frac{1}{2} \left\{ \frac{pN}{c \left(\left(\frac{\hat{c}}{N} \right)^{\rho/(1-\rho)} + 1 \right)} + \frac{V^0}{v(\hat{c}/N)} \right\} \\ &= \frac{1}{2} \left\{ \frac{pN}{cv(\hat{c}/N)^\rho} + \frac{V^0}{v(\hat{c}/N)} \right\}. \end{aligned}$$

Clearly, the right hand side is increasing in V^0 , p and N , and decreasing in c and $(1-\tau)$. Since the left-hand side is monotonically increasing in T^* , we have the needed comparative statics. \square

C List of Worker Rights Clauses by Topic

This appendix provides ten example clauses for each of the topics extracted for worker rights clauses. The topics are listed in the order from Table 3. At the end, the two miscellaneous occupation-specific topics for teachers, which were dropped from the main analysis, are listed. For each topic, we recap the title, wage-similarity score, topic share, and GPT-4 summary. The 10 listed clauses are those used to construct that GPT-4 summary.

1. **Grievance & Discipline** 0.15900 0.031 The clauses provide workers with rights related to disciplinary actions, grievance procedures, and representation, ensuring transparency, due process, and the ability to challenge or appeal employer decisions.

- 1. More severe disciplines will be purged from the employee's personnel file after twenty-four (24) months if the employee receives no additional disciplinary actions, of a similar nature, during that period.
- 2. in such cases, employees shall be offered an irrevocable choice of either a formal or informal investigation.
- 3. The claim by an employee, other than a probationary employee, that he has been suspended or discharged without just cause may be presented as a grievance within seven (7) calendar days after the employee has been notified of his suspension or discharge and such grievance will be processed in the following manner:
- 4. An employee wishing to dispute any such entry shall be entitled to recourse through the grievance procedure.
- 5. If the complaint affects the rate of pay of an employee, the Department Steward shall be informed.
- 6. If the Employer representative is unable to meet the Steward during the Steward's normal working hours, the Steward shall be paid for all the time spent during the processing of the grievances with the Employer on the Employer's property or at any other place which is mutually agreed upon by both the Union and the Employer.
- 7. If no written decision has been given to an employee at Step No. 1 within the time limits specified above, the grievance will be settled in favour of

the grievor provided that such settlement shall not prejudice any future such complaint or grievance, or the employee shall be entitled to submit the grievance to the next stage including arbitration.

- 8. The names of the Grievance Committee, Chairman and Stewards, or where absent a substitute, from time to time selected shall be given to the Home in writing and the Home shall not be required to recognize any steward until it has been notified in writing by the Union of the name of same.
- 9. The employee and the Union will be given a copy of any warning, reprimand, suspension or disciplinary layoff entered on any employee's personnel record, within two (2) working days of the alleged violation becoming known to the Company.
- 10. 5.1 A newly hired employee shall be informed in writing whether his or her position is within the bargaining unit, the name and address of the bargaining agent and the name and work location of the local Union steward which shall be provided as per Article 22.5.4 (Grievance Procedure).

2. **Job Security** 0.16773 0.03 The clauses provide workers with rights related to job security and stability, including provisions for notification and options in the event of workforce adjustments, opportunities for training or retraining, recall rights for seasonal or displaced employees, and protections for seniority and pay rate in cases of job changes or redundancies.

- 1. If the position is affected by a workforce adjustment, the employee will be notified and provided with an opportunity to exercise her options under Article 34 unless otherwise agreed by the parties.
- 2. Where a nurse receives training under this provision, she or he need not be considered for any further vacancies for a period of six (6) months from the date she or he is placed in the position.
- 3. 36.7 Recall Subject to the establishment of labour requirements for the following season, seasonal employees will be offered seasonal employment for the subsequent work season by the employer.
- 4. Such reinstatement or placement will be without loss of seniority and at not less than the same rate of pay to which the employee would be entitled

had she remained in her former position.

- 5. Any employee who is declared redundant to a work location shall be given the option of transferring to the first available position of equal classification or be demoted to the next lower classification.
 - 6. The nurse shall be reinstated to her former position unless the position has been discontinued in which case she shall be given a comparable job.
 - 7. An employee who is displaced by technological change or mechanization shall be given the opportunity to fill another vacancy if capable of doing so and according to seniority or be given a period of training sufficient to perfect or acquire the skills necessitated by the new methods of operation.
 - 8. If an Employee has moved into an area to work on a project and his employment has been terminated, and such Employee does not remain in the area sixty (60) days after termination to qualify as a local resident, and such Employee is hired by the aforementioned Employer or a new Employer, such Employee shall be treated as a non-resident for all purposes and conditions of this Agreement.
 - 9. b) Employees with recall-reinstatement rights will be offered the position in accordance with Article 79.02 c)
 - 10. Such regularly assigned employees shall be protected by guarantee providing they take up their new assignment within the first cycle of operation of the run of their choice commencing from the date of selection.
3. **Recall** 0.17688 0.032 The clauses provide rights related to job security and recall for workers who have been laid off, including options to accept vacant positions, refuse temporary recalls without penalty, and priority for rehiring in their former or equivalent positions if they become available.
- 1. Employees who are laid off will be entitled to recall to classifications in their OGL for a period of three (3) years from the date of his/her layoff.
 - 2. When an Employee has been given notice of lay-off, the Employee has the option of: a) Accepting a vacant position, if available, provided the Employee meets the minimum requirements to perform the position.
 - 3. An employee who has been recalled to such temporary vacancy shall not be required to accept such recall and may instead remain on lay-off.

- 4. Whenever it becomes necessary to reduce the work force, the employee affected shall be given
- 5. Tradesmen not working at their trade and all other employees involved will receive the established shutdown rate.
- 6. An employee who has been recalled to such temporary vacancy shall not be required to accept such recall and may instead remain on layoff.
- 7. An employee recalled to work in a different classification from which she was laid off, or an employee who has displaced an employee in a lower or identical paying classification shall be entitled to return to the position she held prior to the layoff should it become vacant within six (6) months of the layoff, provided that the employee remains qualified and able to perform the duties of her former position.
- 8. No new employees shall be hired until all those laid off have been given an opportunity to return to work and have failed to do so, in accordance with the loss of seniority provision, or have been found unable to perform the work available.
- 9. An Owner/Operator who receives a notice of lay-off (a)
- 10. a full-time employee who has displaced a part-time employee shall be entitled to return to the position he held prior to the layoff should it become vacant within twenty-four (24) months of the layoff, provided that the employee remains qualified and able to perform the duties of his former position.

4. **Notice Requirements** 0.17505 0.027 The clauses provide workers with rights to receive advance notice regarding absences, layoffs, job vacancies, shutdowns, and meetings, ensuring they have adequate time to prepare for changes in their employment status or work conditions.

- 1. Where possible, the Employer will be provided with two weeks notice of such absences.
- 2. he/she shall be paid schedule wages for the time in excess of 10 days whatever the decision might be.
- 3. Written notice of the proposed shutdown shall be given to the Union not later than two (2) weeks in advance of the shutdown date, in the event

an Employee is included in the shutdown, the employee will be paid his accumulated Vacation Pay, if any in the accrued amount to the end of the pay period immediately proceeding the shutdown.

- 4. Unlicensed personnel will receive a notice of seventy-two (72) hours prior to joining the ship unless exceptional circumstances arise.
- 5. Each employee who applies for a posted vacancy during the seven (7) day posting period will be notified in writing of the disposition of her application.
- 6. Employees in these categories will receive twenty-four (24) hours written notice of lay- off).
- 7. Where practical, the employee shall receive a minimum of one (1) day's notice of such a meeting and shall be informed of the reason for it.
